

1: TCIA | A Standards

ANSI A standards are the generally accepted industry standards for tree care practices. They are voluntary industry consensus standards developed by TCIA and written by a committee called the Accredited Standards Committee (ASC) A, whose mission is to develop consensus performance standards based on current research and sound practice for.

They are generally accepted to be the industry standards for tree care practices. The ANSI A standards are divided into nine parts, each focused on a particular aspect of tree care. This article examines the first three parts, which focus on pruning and trimming operations, soil management, and supplemental support systems. The four basic pruning methods recommended by the A pruning standards are: The selective removal of dead, diseased, or broken branches. Selective pruning intended to reduce crown density. Selective pruning of lower branches to provide vertical clearance. It establishes voluntary standards for soil management under three subsections: Under the modification section, part two of the A standards examines how to properly evaluate the condition of soil, how to manage organic matter in soil, how to incorporate soil amendments, and how to apply organic mulch to the surface of a soil site. The modification section also explores prevention and mitigation practices for soil compaction. The fertilization section assesses the impact of pH adjustments on soil. It also describes fertilization practices, recommended methods of application, and calculations for fertilizer amounts. The fertilization methods recognized under the fertilization section are: The application of dry fertilizer on the soil surface. The application of dry fertilizer below the soil surface. Subsurface Liquid Fertilizer Injection: The application of liquid fertilizer below the soil surface. The practice of spraying a liquid directly on the foliage. Injecting a liquid directly into the plant. The process of implanting a solid directly into the plant. The drainage section of the A standards discusses the mitigation of impenetrable soil layers, as well as the mitigation and adjustment of surface drainage, and subsurface drainage. As a general rule, the drainage section advises against surface applications where surface runoff is likely to occur. ANSI A Standards Part 3 "Supplemental Support Systems Part three of the A standards applies to installation and maintenance of tree support systems, including cabling, bracing, guying, and propping. The subjects it examines are: Tools and equipment used for performing support system installations. The objectives of cabling, bracing, and guying. The types of cabling systems and bracing techniques recommended for use. Guying methods, including tree-to-ground guying and tree-to-tree guying. Propping procedures for trees and branches. Each subject is accompanied by a series of tables that describe hardware sizing and selection. The A Supplemental Support Systems standards recommend four basic cabling methods: Direct cabling consists of a single cable installed between two sections of a tree. Cables can be installed between two limbs, two stems, or a trunk and a limb. Triangular cabling involves connecting sections of a tree in combinations of threes. This method is ideal for providing trees with maximum support. Box cabling is when four or more sections of a tree are connected together in a closed series. This method should only be used when minimal direct support is required. Hub and spoke cabling consists of a hub that acts as a center attachment with spans of cable radiating to three or more leaders. Hub and spoke cabling should only be used when no other cabling system is deemed viable. According to the A standards, supplemental support systems should receive periodic inspections by an arborist. Trees may displace cabling systems as they continue to grow. If cables are not located two thirds of the way up the tree, the A standards recommend updating the system. Supplemental support systems do not provide primary support to a tree. Their purpose is to provide trees with additional support, or restrict their movement. To purchase a copy of one of these standards, visit: All estimates are free of charge. We look forward to hearing from you.

5: ANSI A - Wikipedia

The ANSI standards represent the industry criteria for performing tree care operations. The standards can be used for general familiarity with professional requirements, as well as for preparation of tree care contract specifications.
