Flexowriter keyboard with 13 function keys on the right. Although the Flexowriter could be used as a computer terminal, this electromechanical typewriter was primarily intended as a stand-alone word processing system. The interpretation of the function keys was determined by the programming of a plugboard inside the back of the machine. Later models replaced this with a numeric keypad, and moved the function keys to 24 keys at the top of the keyboard. The classic Mac OS supported system extensions known generally as FKEYS which could be installed in the System file and could be accessed with a Command-Shift- number keystroke combination Command-Shift-3 was the screen capture function included with the system, and was installed as an FKEY; however, early Macintosh keyboards did not support numbered function keys in the normal sense. Since the introduction of the Apple Extended Keyboard with the Macintosh II, however, keyboards with function keys have been available, though they did not become standard until the mids. They have not traditionally been a major part of the Mac user interface, however, and are generally only used on cross-platform programs. According to the Macintosh Human Interface Guidelines, they are reserved for customization by the user. Current Mac keyboards include specialized function keys for controlling sound volume. Former keyboards and Apple Keyboard with numeric keypad has the F1-F19 keys. Function keys were not standard on Apple notebook hardware until the introduction of the PowerBook and the PowerBook. For the most part, Mac laptops have keys F1 through F12, with pre-defined actions for some, including controlling sound volume and screen brightness. Atari XL had four additional keys labeled F1 through F4 with pre-defined actions, mainly related to cursor movement. The break, arrow, and copy keys could function as F10-F12. The case included a transparent plastic strip above them to hold a function key reference card. Commodore VIC and C Like the Commodore, this also had a Help key. Graphing calculators, particularly those from Texas Instruments, Hewlett-Packard and Casio, usually include a row of function keys with various preassigned functions on a standard hand-held calculator, these would be the top row of buttons under the screen. On low-end models such as the TI-series, these function mainly as an extension of the main keyboard, but on high-end calculators the functions change with the mode, sometimes acting as menu navigation keys as well. HP series terminals An early use of function keys These keys, along with "Enter," "Help," and several others, generate "AID codes," informing the host computer that user-entered data is ready to be read. F1 to F12 usually in three 4-key groups across the top of the keyboard. Some IBM compatible keyboards, e. Many modern PC keyboards also include specialized keys for multimedia and operating system functions. Action on various programs and operating systems[ edit ] Mac OS[ edit ] In the classic Mac OS, the function keys could be configured by the user, with the Function Keys control panel, to start a program or run an AppleScript.
