

AUTOCAD DEVELOPERS GUIDE TO VISUAL LISP pdf

1: AutoCAD Programmers Reference Guide - AutoLISP, Visual LISP & DCL - AutoCAD Forums

The book title is misleading - it calls itself a 'developer's guide to visual lisp' when in fact, 36 pages (less than 10% of the book) is dedicated to that topic. Almost pages of the book goes over the main AutoLisp functions - but hey, I've got an AutoCAD 14 book that explains that topic better.

Adding Watch The watch list allows you to examine the value of a variable during execution. To bring up the watch window, click on . To add a variable to the watch list, type Ctrl-W or click on the icon. When prompted, type in the variable name you wish to watch. **Inspecting** In addition to just watching the variable, you can also inspect it. By double-clicking on a variable in the watch window, you can get even more detailed information about that variable. Alternatively, you can also click on icon and enter a variable name. **Error Trace** Sometimes an error occurs in your program and you have no idea what part of the code is causing the problem. Visual LISP provides you with a tool to pinpoint errors it finds. Find the LISP statement just below the first error message. The problematic code should be highlighted in your text window. **Toggle Breakpoints** Breakpoints allow you to mark a position in the program at which program execution should be interrupted. You can then step through the program part by part. To place a breakpoint, position the cursor where you want the breakpoint and click on or press F9. You can remove the breakpoints in a similar fashion. After placing a breakpoint, load the code. At this point 6 new debugging icons appear. If there is no nested expressions, it jumps to the next expression in sequence. This may be another break loop or the top-level read-eval-print loop. In other words, stop debugging. During debugging mode, you can also change the value of any variable in the program through the console window. Simply set the value of the variable to the desired value. Once you load the program, it will start the debug mode at the first expression Visual LISP encounters. During the animate mode, Visual LISP steps through your code and evaluates each expression automatically. Visual LISP will then highlight each expression it evaluates as it goes through your program. That way, you can see the results of your program on the screen as well. To stop the animation, press Break. **Commenting and Uncommenting** You may turn a line of text into comment so that it will be skipped by AutoLISP, or uncomment it back to a part of your program. This is sometimes very useful for debugging. Send questions and comments to takehiko mit.
