Background[ edit ] After its victory in the American Revolutionary War , the fledgling United States became sovereign over an area stretching along the Atlantic seaboard from New Hampshire to Georgia , and as far inland as the Mississippi River , encompassing an area exceeding that of any western European nation of the time. While the coastal trade was relatively developed, the nation possessed limited transportation and communication lines with its interior, other than advantageous interior river systems and their interconnecting portages. For the new lands in the Northwest Territory , the Congress of the Confederation set precedent with the Northwest Ordinance concerning ownership of the lands, with known transportation routes as "common highways and forever free. The preliminary report of the Inland Waterways Commission in provides a description of the early development of transportation and communication infrastructure: There the deliberations resulted in the framing of the Constitution, whereby the thirteen original States were united primarily on a commercial basis â€” the commerce of the times being chiefly by water. While transportation needs were universally recognized, many Anti-Federalists opposed the federal government assuming such a role. Further westward extensions were constructed to Vandalia, Illinois , but financial crisis ultimately prevented its planned western extension to the Mississippi and Missouri Rivers. Nevertheless, the road became a primary overland route over the Appalachian Mountains and the gateway for the surge of westward-bound settlers and immigrants. Canals[ edit ] USA canals circa Canal companies had also been chartered in the states, and like turnpikes these early canals were constructed, owned, and operated by private joint-stock companies. Of all the canals projected for construction, only three had been completed when the War of broke out: After the war, New York authorized construction of the Erie Canal in Proposed by Governor of New York De Witt Clinton , the Erie was the first canal project undertaken as a public good to be financed at public risk through the issuance of bonds. This bold bid for the western trade to their north alarmed the competing merchants of Philadelphia, since the completion of the National Road also threatened to divert much of their traffic south to Baltimore. In , the legislature of Pennsylvania grappled with the problem by projecting a series of canals to connect Philadelphia with Pittsburgh in the west and with Lake Erie and the upper Susquehanna to the north. Before , the Corps supervised the construction of coastal fortifications, but they also constructed lighthouses, helped develop jetties and piers for harbors, and carefully mapped the changing navigation channels. Although temporarily downsized following the war, the Corps was reestablished in and began constructing and repairing fortifications in Norfolk and New Orleans. The fortification appropriations proliferated during the five years of diplomatic tension that preceded the War of ; these substantially expanded the system of fortifications protecting New York Harbor and convinced the commanders of the British navy to avoid attacking that strategic location. Following the war, the United States soon developed an expanded system of more modern fortifications to provide the first line of land defense against the threat of attack from European powers. Federal assistance for internal improvements evolved slowly and haphazardly â€” the product of contentious congressional factions and an executive branch generally concerned with avoiding unconstitutional federal intrusions into state affairs. Later, in , Democratic-Republican President Jefferson also had recommended many internal improvements for Congress to consider, including the creation of necessary amendments to the Constitution to allow themselves such powers. In much alarm Jefferson suggested to Madison the desirability of having Virginia adopt a new set of resolutions, founded on those of , and directed against the acts for internal improvements. The magnitude of the transportation problem was such that neither individual states nor private corporations seemed able to meet the demands of expanding internal trade. These improvements would generally be upon public lands under the exclusive jurisdiction of the federal government, not internal State lands. However, the only contribution of the federal government to internal improvements during the Jeffersonian era was an appropriation in of two percent of the net proceeds of the sales of public lands in Ohio

for the construction of a national road, with the consent of the states through which it should pass. Even non-federalist President James Madison invited the attention of Congress to the need of establishing "a comprehensive system of roads and canals". Because this appropriation was to be met by the moneys paid by the National Bank to the government, the bill was commonly referred to as the " Bonus Bill ". But on the day before he left office, Madison vetoed the bill because he felt it was unconstitutional. Having less regard for consistency, the House of Representatives recorded its conviction, by close votes, that Congress could appropriate money to construct roads and canals but did not have the power to construct them. In , a bill to authorize the collection of tolls on the Cumberland Road was vetoed by President James Monroe. In an elaborate essay, he set forth his views on the constitutional aspects of a policy of internal improvements. Congress might appropriate money, Monroe admitted, but it might not undertake the actual construction of national works nor assume jurisdiction over them. For the moment the drift toward a larger participation of the national government in internal improvements was stayed. The situation would change dramatically two years later, however, with Supreme Court rulings that would resolve the related constitutional questions with some finality. Ogden , ruling that the power to regulate interstate commerce was granted to Congress by the Commerce Clause of the United States Constitution. The Court went on to conclude that Congressional power extends to the regulation of all aspects of commerce, overriding state law to the contrary. He called attention to provisions made for coastal surveys and lighthouses on the Atlantic seaboard and deplored the neglect of the interior of the country. Crawford felt the constitutional scruples being voiced in the South, and followed the old expedient of advocating for a constitutional amendment to sanction national internal improvements. In April Congress passed the General Survey Act , which authorized the president to have surveys made of routes for roads and canals "of national importance, in a commercial or military point of view, or necessary for the transportation of public mail;" [10] this is sometimes referred to as the first "Roads and Canals" Act. The president assigned responsibility for the road, canal and waterway surveys as well as the navigation improvements to the Corps of Engineers, marking marked the beginning of its continuous involvement in domestic civil works. The new legislation authorized the president to have river surveys made to clean out and deepen selected waterways and to make various other river and harbor improvements. It was also the first legislation of this type to combine authorizations for both surveys and projects, thereby establishing the pattern for future work. In March the Virginia general assembly declared that all the principles of their earlier resolutions applied "with full force against the powers assumed by Congress" in passing acts to further internal improvements and to protect manufacturers. That the John Quincy Adams administration would meet with opposition in Congress was a foregone conclusion.
