Page 2 of 3 Low latency period: The core layer typically uses high-speed low latency circuits which only forward packets and do not enforcing policy. Multiple data paths ensure high network fault tolerance; if one path experiences a problem, then the device can quickly discover a new route. At the core layer, efficiency is the key term. Fewer and faster systems create a more efficient backbone. There are various equipments available for the core layer. Examples of core layer Cisco equipment include: It also provides policy-based network connectivity, including: Processes packets and regulates the transmission of packets based on its source and destination information to create network borders. The router or layer 3 switches can read packets and prioritize delivery, based on policies you set. Access Layer Aggregation Point: The layer serves the aggregation point for the desktop layer switches. Control Broadcast and Multicast: The layer serves as the boundary for broadcast and multicast domains. The layer allows you to create protocol gateways to and from different network architectures. The distribution layer also performs queuing and provides packet manipulation of the network traffic. It is at this layer where you begin to exert control over network transmissions, including what comes in and what goes out of the network. You will also limit and create broadcast domains, create virtual LANs, if necessary, and conduct various management tasks, including obtaining route summaries. In a route summary, you consolidate traffic from many subnets into a core network connection. In Cisco routers, the command to obtain a routing summary is: Examples of Cisco-specific distribution layer equipment include ,, series routers Access Layer The access layer contains devices that allow workgroups and users to use the services provided by the distribution and core layers. In the access layer, you have the ability to expand or contract collision domains using a repeater, hub, or standard switch. In regards to the access layer, a switch is not a high-powered device, such as those found at the core layer.
