Abstract The M22 standard provides information on quality control of commercially prepared microbiological culture media to users and manufacturers. MA3 is a revision of the approved standard, MA2, published in December. The standard applies to all commercial media listed in Table 2 regardless of packaging, plate, or tube design. The media included in MA3 are from three surveys conducted by the College of American Pathologists. The third survey, conducted in the fall of , was performed in response to the many requests for further expansion of the exempt media list. MA3 lists an additional 27 exempt media. THE NCCLS consensus process, which is the mechanism for moving a document through two or more levels of review by the healthcare community, is an ongoing process. Users should expect revised editions of any given document. Because rapid changes in technology may affect the procedures, methods, and protocols in a standard or guideline, users should replace outdated editions with the current editions of NCCLS documents. Current editions are listed in the NCCLS Catalog, which is distributed to member organizations, and to nonmembers on request. **Reasons Given for Lot Failures Performance Check of Nonexempt Media Processing of Exempt Media** In response, the College of American Pathologists CAP conducted three laboratory surveys to determine the failure rates of commonly used media. The third survey, conducted in , allows the addition of 27 media to the exempt list. The data, however, cause concern. Manufacturers perform quality control on all media sold to customers. Less than optimum storage conditions may contribute to medium failure. Media are shipped, stored, and delivered nonrefrigerated by the manufacturer or distributor. Specialty media that require more fastidious quality control organisms also often exhibit higher failure rates. Separate, limited surveys of different U. Until resolution of these issues, clinical laboratories must continue to verify the performance of certain medium types.
