You can view the Oracle Database Library at http: Use the following command to execute operating system commands: Enter HOST without command to display an operating system prompt. You can then enter multiple operating system commands. With some operating systems, you can use another character instead of HOST such as "! Use the following command to recall the history of SQLcl commands: History is limited to the last statements. History is retained between SQLcl sessions. To separate text from the preceding characters with a space, enter two spaces. To append text that ends with a semicolon, end the command with two semicolons a single semicolon is interpreted as a command terminator. Enter DEL with no clauses to delete the current line of the buffer. Enter LIST with no clauses to list all lines. Use the following commands to run scripts: The script can be called from the local file system or a web server. You can pass values to script variables in the usual way. This command is almost identical to the command. It is useful for running nested scripts because it has the additional functionality of looking for the specified script in the same path or url as the calling script. The maximum sleep interval is seconds. Use the following commands to create and modify scripts: To edit the buffer contents, omit the file name. Inline will set the editor to be the SQLcl editor. This supports the following shortcuts: The REMARK command must appear at the beginning of a line, and the comment ends at the end of the line a line cannot contain both a comment and a command. SQLcl does not interpret the comment as a command. Use the following commands to write interactive commands: Use the following commands to create and display bind variables: Use the following symbols to create substitution variables and parameters for use in scripts: START substitutes values you list after the script name as follows: SQLcl substitutes the value of the specified substitution variable for each substitution variable it encounters. Linux distributions can leverage an extensive range of commands to accomplish various tasks. For most Linux distros, Bash bourne again shell is the default command-line interface or shell used to execute these commands. In this A to Z list of Linux commands, we have tried to include as many commands as possible which can be run using bash. CLIs command-line interface have existed since ages. However, CLI is just an interface, the main task is done by a program called command language interpreter. In the past, we compiled the list of commands for the CMD command-line interpreter in Microsoft Windows, you can take a look at it below: The first piece of text you see when you land on the shell is called prompt. However, the terminal application you see on your Linux systems is an emulator that replicates the jobs of a real-world terminal. Many people often confuse the terms shell and terminal. Take the example of a car; the body of the car is the terminal and the dashboard can be considered as the shell where you perform various operations like acceleration, reverse, shifting, etc. The car responds to your actions performed using the dashboard. Similarly, the terminal displays responses for the commands executed using the shell or CLI. Is Linux CLI case-sensitive? If you try to run LS instead of ls, it would display an error. There are some advantages of using a case-sensitive command line. It also gives people the flexibility over the choice of the command name. As you might be knowing, some or many of these commands may not work on your distribution. The descriptions of these Linux commands are based on their manual pages.
