

1: Isle of the sea eagle: 'It's our version of the wolf' | Environment | The Guardian

Conflict of the Eagles is a March of the Eagles mod that spans the early 21st century. With a start date of ranging all the way until , the mod has a tri-pronged focus on economics, politics and recent history. The player must take control of any nation, insurgency or group having existed.

Share via Email With wings like planks, a sea eagle on the Isle of Mull plucks a fish from the water. RSPB Images We are lurching along the loch when the 25 seagulls hanging above our boat suddenly scatter. A dark shape materialises low over the water, gaining on us fast. With wings like planks and a meat-cleaver for a beak, the white-tailed eagle fixes its eyeballs twice as large as ours on the boat. Taking great scoops of air with each flap, it stretches yellow talons to pluck a fish from the water. It is 40 years since a revolutionary reintroduction programme began to return the white-tailed eagle, also known as the sea eagle, to the Scottish Highlands; 30 years since the first chicks fledged; and this year, the number of nesting pairs will exceed for the first time. But for all the celebrations, some people still detest our biggest carnivorous creature. Everywhere you go, holidaymakers train their binoculars on the twisting coastline, searching for sea eagles, golden eagles and otters. For David Sexton of the RSPB , the man responsible for managing the complex relationship between people and eagles here, spring is a stressful time. The birds are hatching chicks, vulnerable to late snow, and then he gets an early phone call. Just that morning, a farmer found an eagle plucking at a dead lamb in a field. In the woods beyond is a white-tailed eagle nest the size of a treehouse. With its 8ft wingspan and massive nests, it is conspicuous and, unlike the notoriously wary golden eagle, an inquisitive animal. A totemic symbol for neolithic people who buried their dead with white-tailed eagles on Orkney, it was all too easily trapped, poisoned and shot to extinction, the last bird killed in . Over a decade from , 82 young eagles were brought from Norway and released on the island of Rum. Typically, the eagles did things their way and flew over to Mull, where they began nesting. In , Sexton came to the island to undertake covert nest surveillance. It was so secretive he even had a cover story â€” he was studying rare red-throated divers. At that point, the reintroduction was in crisis: The next year, the same pair tried again:

Air Force and the U. Navy fought each other over future tactical aircraft. Defense Secretary Robert McNamara was pressing for both services to use as many common aircraft as possible, even if performance compromises were involved. As part of this policy, the USAF and Navy had embarked on the TFX F program, aiming to deliver a medium-range interdiction aircraft for the Air Force that would also serve as a long-range interceptor aircraft for the Navy. The A-4 and A-7 were more capable in the attack role, while the F-5 less so, but could defend itself. If the Air Force chose a pure attack design, maintaining air superiority would be a priority for a new airframe. The next month, a report on light tactical aircraft suggested the Air Force purchase the F-5 or A-7, and consider a new higher-performance aircraft to ensure its air superiority. Meanwhile, the Air Force chose the A-7 over the F-5 for the support role on 5 November , [9] giving further impetus for an air superiority design as the A-7 lacked any credible air-to-air capability. Eight companies responded with proposals. Following a downselect, four companies were asked to provide further developments. In total, they developed some design concepts. Theory had stressed long-range combat using missiles and optimized aircraft for this role. The result was highly loaded aircraft with large radar and excellent speed, but limited maneuverability and often lacking a gun. Marine Corps to provide air superiority over Vietnam, the only fighter with enough power, range, and maneuverability to be given the primary task of dealing with the threat of Soviet fighters while flying with visual engagement rules. Missiles proved to be much less reliable than predicted, especially at close range. Although improved training and the introduction of the M61 Vulcan cannon did much to address the disparity, these early outcomes led to considerable re-evaluation of the Project Forecast doctrine. Through tireless championing of the concepts and good timing with the "failure" of the initial F-X project, the "fighter mafia" pressed for a lightweight day fighter that could be built and operated in large numbers to ensure air superiority. The resulting studies took 18 months and concluded that the desired features were too different; the Navy stressed loiter time and mission flexibility, while the Air Force was now looking primarily for maneuverability. The added weight demanded a much larger wing to allow the aircraft to operate at the required high altitudes. However, to observers, it appeared outwardly similar to the very large F-X studies, an aircraft with high speed and a large wing offering high maneuverability, leading to serious concerns throughout the Department of Defense and the various arms that the US was being outclassed. The MiG was likewise a subject of concern, and it was generally believed to be a better aircraft than the F. Holloway pressed for a pure air-superiority design that would be able to meet the expected performance of the MiG. VFX was considerably closer to the evolving F-X requirements. However, details of the avionics were left largely undefined, as whether to build a larger aircraft with a powerful radar that could detect the enemy at longer ranges was not clear, or alternatively a smaller aircraft that would make detecting it more difficult for the enemy. The companies submitted technical proposals by June. It was dropped in favor of the standard M61 Vulcan gun. The F used conformal carriage of four Sparrow missiles like the Phantom. The fixed wing was put onto a flat, wide fuselage that also provided an effective lifting surface. It would use computer technology with new controls and displays to lower pilot workload and require only one pilot to save weight. Unlike the F or F-4, the F has only a single canopy frame with clear vision forward. The APG radar uses a programmable signal processor PSP, enabling the radar to be reprogrammable for additional purposes such as the addition of new armaments and equipment. Existing Fs were retrofitted with these improvements. The EPAWSS is an all-digital system with advanced electronic countermeasures, radar warning, and increased chaff and flare capabilities in a smaller footprint than the s-era Tactical Electronic Warfare System. More than FCs and FEs will have the system installed. Ailerons and a simple high-lift flap are located on the trailing edge. No leading-edge maneuvering flaps are used. This complication was avoided by the combination of low wing loading and fixed leading-edge camber that varies with spanwise position along the wing. Composite horizontal all-moving tails outboard of the vertical stabilizers move independently to provide roll control in

CONFLICT OF EAGLES pdf

some flight maneuvers. The F has a spine-mounted air brake and retractable tricycle landing gear. The airframe began to incorporate advanced superplastically formed titanium components in the s. The weapons and flight-control systems are designed so that one person can safely and effectively perform air-to-air combat. B and D models add a second seat behind the pilot for training. E models use the second seat for a weapon systems officer.
