

1: Soap, Sanitizer And Dispenser Purchasing Habits

Please fill in the above form and we will endeavour to respond within 24hrs (Mon-Fri).

With over 54, independent building service contractors BSCs in the United States who clean and maintain commercial, industrial and institutional facilities, contract cleaners make up the largest end users of janitorial and housekeeping products. In an effort to keep building cleanliness top priority, BSCs often seek out opportunities to enhance customer satisfaction within the entire building. Common issues found in facility restrooms range from dirty floors to clogged toilets to leaking and malfunctioning soap dispensers. In addition to a poor appearance, dirty, broken or empty soap or sanitizer dispensers can lead to health implications. SC Johnson Professional, through its Pro Cleaning Council, recently surveyed more than BSCs about their soap and dispenser purchasing habits, as well as their hopes for future dispensing systems and innovations. The Scoop on Soaps and Sanitizers Conducted in October , the Pro Cleaning Council study found that the two most common types of soap purchased by BSCs were foam soap and antibacterial hand cleansers. Ninety-four percent of respondents have purchased foam soap, 85 percent have purchased antibacterial hand cleanser and 70 percent have purchased foam hand sanitizer. Furthermore, 83 percent of BSCs stated they are very likely to purchase antibacterial hand soap within the next six to 12 months. Very few participants 6 percent were somewhat unlikely or very unlikely to purchase antibacterial hand soap due to several reasons, including: However, not all dispensers are the same. A recent study by the University of Arizona found that popular refillable bulk soap dispensers can become a haven for bacteria, contaminating soap and defeating the purpose of hand washing. Using sealed soap cartridges can minimize the risk of contamination. Utilizing antimicrobial technology, such as BioCote, also helps reduce the number of germs on soap dispensers. The survey delved deeper into what BSCs are looking for when it comes to soap dispensers. The Pro Cleaning Council found that BSCs prefer touch-free counter mounted soap dispensers because they are known to limit the spread of germs. In addition, BSCs also look for the following qualities in soap dispensers: BSCs seek dispensing systems with a long battery life to limit clogging and promote consistent use. In addition to long battery life, BSCs seek dispensers that have sensitive motion sensors to ensure product is dispensed properly and accurately. For both the customer and BSC, ease of use is top priority. A dispenser should be simple to use and easy to refill and clean. Some respondents reported drip issues, resulting in a messy floor or counter and wasted product. The survey showed that dispensers with drip trays or that have dripless designs were highly desired. BSCs want to be able to count on the products they provide to customers, stating that a reliable, low maintenance and long-lasting dispenser is key to them and their customers. The ability to see how much product remains within the dispenser, such as a sight window, was another common request among BSCs. Survey participants also revealed that they search for dispensers with a sleek, professional look and unique design features. Most dispensers are available in a simple white or black, often blending into the background of a restroom. However, there are companies that offer dispensers in a rainbow of color options, as well as offer unique branding opportunities. Some dispensers allow you to feature custom logos or images and insert text, such as a company tagline or school motto. Some common themes included: Currently, some dispensers feature built-in visible indicators to notify facility managers when refills and batteries require replacement to simplify maintenance. With bulk dispensers, leaks and spills are more common. This helps control both usage and cost as well as reduce product waste. Additionally, some dispensers now feature non-drip mechanisms to ensure no mess. While the results of the study showed that many BSCs are currently satisfied with their soap, sanitizer and dispensing needs, there is always room for improvement. With the right product and dispenser, BSCs can add the finishing touches on a clean, pleasant and well-maintained facility. Isabelle Faivre is the U. 2: What is the difference between detergent and disinfectant? - www.enganchecubano.com Specialties

This vertical directory comprehensively lists the most trusted companies providing Disinfectant Soap to industry. This is an industrial directory listing all companies which are manufacturers, service companies and distributors and provide Disinfectant Soap.

Disinfectant Kills disease causing germs on surfaces. This process is accomplished with germicides or physical agents such as high heat. A disinfectant is a chemical capable of killing some germs microbes under certain conditions. Disinfectants do not clean dirt or grease, this is the job of detergents. Disinfectants and detergents should never be mixed together unless recommended by the manufacturer, as the two kinds of chemicals may work against one another producing a solution which neither kills germs nor assists in cleaning. The strength of disinfectant solutions is important: Disinfectants are used in areas where it is necessary to kill germs microbes for the safety and health of humans and animals, such as toilets, sinks, food preparations areas, hospitals, floors, drains, kitchens, etc. Disinfectants can also be used to clean items such as mops, buckets, brushes, cleaning cloths, clothes, etc. Disinfectants can indeed be dangerous if they are too strong – in other words, not properly diluted. Disinfectants can harm the skin and eyes and give off strong fumes. There are many disinfectant products on the market, so be absolutely sure that the one you use is recommended for the job you are doing and you follow the manufactures instructions. A detergent is a chemical that is a wetting agent and, when combined with clean, hot water, dissolves grease and cleans more easily. A detergent is a cleaner; it does not kill germs microbes. Also, it is important to change detergent water frequently, otherwise germs microbes carried in the dirt will be moved from place to place. Detergents are used anywhere where it is necessary to remove dirt or grease, such as floors, toilets, benches, showers, sinks, etc. In some cases you may need to use a detergent and then a disinfectant – but never mix the two products together. Disinfectants can sometimes be dangerous. There are many different products on the market, so be absolutely sure that the one you use is the correct detergent for the job at hand, and that you follow the manufactures instructions. To clean a dirty surface, one uses a detergent, mixed in water, to break up and dissolve the soil particles. The detergent, suspended in water, encapsulates the soil particles and uses the water as the vehicle that transports the soil to the mop bucket or hand bucket and eventually down the drain. When the detergent is mixed in fresh water, the detergent bubbles have no cargo to carry away until it is applied onto the soiled surface. So, a detergent used for cleaning is free of cargo when it is first mixed in water. The cargo, the soil to be removed, awaits the arrival of the detergent solution to dissolve it and carry it away. The disinfectant ingredients, not the detergent, make up the largest portion of the concentrate formulation. Remove grease, dirt, debris, fats Disinfectant: Disinfectants have no effect on dirt, soil, or dust. These include soap and synthetic detergents SMZ. They are basic goods for personal use and play a significant role in various industries. Antiseptic and disinfectant agents have significant antimicrobial activity. They should have a wide range of antimicrobial action, be active in the presence of body fluids and tissue products decay quickly act in acidic and alkaline environments, dissolve well and have sufficient surface activity, be chemically stable; should not cause corrosion medical instruments, call local irritating, sensitization, to initiate the process of healing. Detergents are commonly available as powders or concentrated solutions. Disinfectants are substances that are applied to non-living objects to destroy microorganisms that are living on the objects.
