### 2: Cow Parsley | Wild Plants

*Cow Parsley and Country Life - Welcome to my oasis of all things country living, from countryside adventures to baking, cooking, home design, decor inspo & more.*

Carrot Family – Apiaceae Umbelliferae Growing form: Stem upper part branched, bristly, grooved, lower part usually short-haired, hollow, joints with septa. Corolla regular, white, approx. Pistil of 2 fused carpels, styles 2. Inflorescence a compound umbel, secondary umbels – Primary umbel lacking bracts, secondary umbels with 5–6-leaved involucre, bracteoles of equal size, elliptic–ovate, sharp-tipped, with hairy edges, green–reddish. Alternate, stalked, base sheath-like. Blade triangular, 3 times pinnate, bright green. Secondary leaflets ovate–elliptic, large-toothed. Elliptic, 2-parted, glossy, glabrous, brown, shiny black when mature, 8–10 mm. Meadows, fields, forest margins, wasteland, yards, gardens, seed lawns, banks, roadsides, broad-leaved forests. Cow parsley spreads abundantly to any place with sufficient light: The leaf rosette grows from seed and takes a few years to gather strength before it flowers, and it usually then dies. The root has however usually by that point produced lateral shoots before the main shoot withers. The flowers attract especially flies to pollinate it, but its abundance and the large amount of nectar and pollen it produces makes it an important plant for bee-keepers too. At the end of the summer the flower develops into a pair of elliptic schizocarps. The seeds are blackish when ripe and they fall before winter comes, so although the stem often remains erect for a long time it is not necessary for the plant. In northern Finland cow parsley is native to broad-leaved forests, the banks of rivers and streams and mountain birch woodland, and it is clearly a different stand from the one that grows on banks in the south of the country, even though there is no clear difference in their appearance. It is hard to say where the plant is native to in the south because the influence of people has clearly changed species that thrive in similar habitats. Garden Chervil *Anthriscus cerefolium* Garden chervil which is a well-known culinary herb, is a close relative of cow parsley. Chervil is an annual and clearly smaller than cow parsley. The Carrot family also includes poisonous species, so wild vegetable enthusiasts would do well to learn to tell them apart.

*Cow parsley stems have a groove, a bit like celery, hemlock doesn't have this. In this last photo you can see a cross section of the stems, again cow parsley on the left and hemlock on the right. Note, the photo isn't of the main stems, but from stems coming off the main stem.*

**Cow Parsley Description** These herbaceous plants have an attractive appearance with dark green leaves and small white flowers. They are among the most commonly seen plants in British countryside. This plant grows about 60 and cm in height. The green hollow slightly hairy stems branch into umbrella like flower clusters. The triangular tripinnate leaves grow between 15 and 30 cm in length with ovate and subdivided leaflets. These fern like leaves grow directly from the stems. These flowering plants are from the umbellifer family. It means they bear their small white flowers in umbrella like clusters. They bear 6 mm long smooth lanceolate fruits. Their distribution range also includes the Mediterranean regions. **Cow Parsley Cultivation** These attractive plants are popularly grown for decorative purposes in wild flower gardens and as a companion plant for various types of ornamental grasses. They are cultivated as hardy biennials or short lived perennials. They cannot survive in water logged soils. These herbal plants most commonly grow in soils with a pH level of 7. Full sunlight is ideal for their proper growth. However, these biennial plants also grow well under light shade. Warm temperate climates are ideal for them to grow properly. One can also sow them around May- June. The seeds take 8 to 10 weeks to germinate. The time taken for germination depends on the climate and temperature. Small plants should be provided with a link stake or brushwood for support before flowering when growing them for the ornamental flowers. It is important to provide them with ample amounts of water especially during the first year of their growth. However, care should be taken to keep the soil well drained. They flower after two years of planting. These self seeding plants die after flowering once. **Harvest** The leaves of these herbal plants can be harvested as required. The flowers bloom in the months of May and June. The roots are harvested by pulling whole plants out of the soil. **Cow Parsley Health Benefits** These herbal medicinal plants have numerous health benefits to offer: The leaves and stems of Cow parsley have anti-inflammatory, antibacterial, antioxidant, antiseptic, antispasmodic, anti-epileptic, antiviral and fungistat properties. The expectorant properties of these herbs make them beneficial for cough, cold and asthma. These plants are also believed to be able to prevent cancer. These anti-depressant, anti-anxiety and anti-stress herbs are beneficial for insomnia and sleeplessness. They are also beneficial for diabetes and leukemia. **Cow Parsley Nutritional Value** These herbal plants are quite rich in various nutrients that help in the growth and immunity of human body. **Picture 2 â€” Cow Parsley Photo Cow Parsley Uses** The leaves, flowers, stems and roots are used for various culinary and medicinal purposes. The leaves are widely used as herb despite having a strong and unpleasant aroma resembling that of carrot. **Culinary Uses** These edible leaves are used in cooking as herbs. Cooked roots of these edible plants are consumed as food. The common name of these herbal plants **Wild Chervil** denotes that they are sometimes used as a substitute for the cultivated herb called Chervil even though they have a stronger aroma. Dried leaves of this plant are used for making herbal tea. **Medicinal Uses** The roots of these medicinal plants are used for making a tonic used for various medicinal purposes. These beneficial plants are used for treating various stomach complaints, digestive disorders and kidney disorders. It is also used for the treatment of dropsy. The infusion of these leaves is used for curing kidney stone and cystitis. It is used for alleviating migraine headache and fighting obesity. This herb is used for treating common cold and fever. **Other Uses** A brilliant green dye can be obtained from the leaves and stems of Wild Chervil. This herb is directly applied to skin as a mosquito repellent. These plants are widely grown as ornamental plants all over the world. Their attractive flowers are used for decoration. **Using Cow Parsley during Pregnancy** It is advisable to avoid using this herb in any form during pregnancy as it is known to induce uterine contractions. **Storing Cow Parsley** The leaves of these herbal plants can be stored after drying them properly. Dried roots can also be stored. Like most other herbs, it should be stored in airtight containers away from direct sunlight. **Cow Parsley Side Effects** There are no known side effects of using this herb in moderate amounts. However, they can cause different side effects in some people. Over consumption may also

cause some adverse effects. One should be very careful while selecting and using the fernlike leaves of these herbal plants, as they look very similar to another poisonous species known as hemlock. Hemlock plants can cause some serious health effects for humans. Wild Chervil can also be confused with giant hogweed. Cow Parsley Interesting Facts Here are some interesting facts about these herbal medicinal plants: These fast growing plants are considered to be disturbing weeds by many gardeners around the world. The Cow Parsley seeds should not be planted around common carrot seeds as they ruin the carrot seeds by hybridizing with them. Cow Parsley Pictures Here are some images of these attractive herbal plants. Their similarity with some poisonous plants is one of the main reasons preventing them from being used for edible and medicinal purposes on a larger scale.

### 4: Heracleum mantegazzianum - Wikipedia

*Isabelle Carrington's husband, unhappy with the apparent disintegration of urban society, decides that they will move to Somerset. The secluded house that they choose seems to welcome Isabelle in a strangely possessive way, and so do the local inhabitants, who appear to have been waiting for her.*

Typically 3 to 4. In Ontario, giant hogweed look-alikes [7] include: *Heracleum sosnowskyi* and *Heracleum persicum*. Other than size as mentioned above, these three species have very similar characteristics. Historical background[ edit ] *Heracleum mantegazzianum* is native to the western Caucasus region of Eurasia. Because of its impressive size, giant hogweed was brought to Europe and North America as an ornamental plant and garden curiosity. The following historical information [12] [15] [16] [13] grew out of the European Giant Alien Project, which began in 1978. By 1980, the first natural population was recorded, growing wild in Cambridgeshire, England. The spread of *Heracleum mantegazzianum* throughout Europe continued unabated until the middle of the 20th century, at which time the dangers of giant hogweed had become more widely known. Despite the warnings, however, the plant continued to be used by gardeners, beekeepers, and farmers for cattle fodder for another 50 years. *Heracleum mantegazzianum* was finally de-listed by the Royal Horticultural Society of Great Britain in 1996. Migration to North America[ edit ] During the 20th century, giant hogweed was transported to the United States and Canada for display in arboreta and Victorian gardens. By 1980, giant hogweed had appeared in southern Ontario, and within a quarter century, the plant was firmly established in Ontario. It was first collected from Nova Scotia in 1980 and Quebec in 1981. Giant hogweed was still available for sale in Canadian nurseries as late as 1996. On the west coast of North America, *Heracleum mantegazzianum* appeared in Oregon, Washington, and southwestern Canada but it is not clear how the species found its way into this region. First reports of giant hogweed in British Columbia were published in the 1980s. Geographical Distribution[ edit ] Distribution of giant hogweed in Europe Giant hogweed is now widespread throughout the British Isles, especially along riverbanks. By forming dense stands, they can displace native plants and reduce wildlife habitats. It has been seen in Quebec since the early 1980s. Contact with the plant sap prevents the skin from protecting itself from sunlight, which leads to phytophotodermatitis, a serious skin inflammation. Photosensitivity peaks between 30 minutes and two hours after contact but can last for several days. Protective clothing, including eye protection, should be worn when handling the plant. If you come in contact with the sap of the giant hogweed, immediately wash the affected area with soap and cold water and avoid further exposure to sunlight for at least 48 hours. Control measures[ edit ] Because of its phototoxicity and invasive nature, giant hogweed is often actively removed. The European Union funded the Giant Alien project to combat the plant. In the UK, the Wildlife and Countryside Act makes it an offence to plant or cause giant hogweed to grow in the wild. Long ago in the Russian hills A Victorian explorer found the regal Hogweed by a marsh He captured it and brought it home
