

1: Windows Networking: Sharing With the Homegroup

How to Create a Homegroup in Windows 10 Quick and Easy - One of the biggest advantages of Windows 10 is the creation of a www.enganchecubano.com process is very quick and easy. You can create a Homegroup of networking between two systems containing operating system Windows

Then, you will learn how to create a Homegroup in both Windows 7 and Windows 8. Once you have created your Homegroup, you will learn how to set a custom password for it and join other Windows computers and devices. Then you will learn how to view and even print the password for your Homegroup, in case you forget it, and how to share libraries and printers with other computers that are part of it. Last but not least you will learn how to leave a Homegroup when you no longer need to use it. How to Change the Workgroup and Computer Name In order for your Homegroup to work well and be able to join and detect other Homegroup computers and devices, you should have the same workgroup set on all the computers in your network. If you have fiddled with this setting on one of your network computers, you should change it so that it matches with other computers in your network. The computer name is not as important as the workgroup. The only rule here is that your computers must have unique names in the network they are part of. If you have two or more computers using the same name, you will encounter conflicts and issues. You can change the workgroup and the computer name using the same procedure. Here you can change both the computer name and the workgroup by typing new values in the appropriate fields. When choosing a new computer name, keep in mind that it should have a maximum of 15 characters and should not include spaces or special characters like: Windows takes some time to apply your changes and then informs you on the success of this change. If you changed the workgroup and everything went well, Windows welcomes you to the new workgroup. Then, you are informed that you need to restart your computer to apply your changes. Choose whether you would like to restart your computer now or later. To leave a workgroup, you can change it using the method described above. When you change to a different workgroup from that used by the computers in your network, your computer will still be discoverable but you will start having issues when sharing with others on the network. The procedure works the same in Windows 8. Therefore, if you use Windows 8. If you are unsure how to do this, please refer to Lesson 4. You are informed that there is currently no homegroup on the network. You are asked to select what you want to share with other computers in the Homegroup. You can select any of the default user libraries and your printers. Windows automatically generates a secure password for your Homegroup. The Homegroup is now created and you can join other Windows computers and devices to it. How to Create a Homegroup in Windows 8. Windows shares information about the Homegroup and how you can use it to share with others on your network. Windows takes a while to create the Homegroup. When done, you are shown several switches for sharing libraries and printers. You will learn more about them in the next sections of this lesson. Also, after these switches, you will see the password that was generated for the newly created Homegroup. The Homegroup is now created and you can start joining other Windows computers to it, and share content and devices between them. Can you Create More than One Homegroup? You cannot create more than one Homegroup on the same network. It will only allow you to join the existing Homegroup. But, your Windows computer or device can be part of more than one Homegroup, if it gets connected to multiple networks. If you take your Windows laptop or tablet with you, you will connect to each of these networks and join the appropriate Homegroup attached to them. Any computer that is part of the Homegroup can change the password. However, this means that you have to rejoin all the computers that are part of that Homegroup, using the new password. We recommended that you change the Homegroup password as soon as you create the new Homegroup, but before joining other Windows computers and devices to it. Go to the HomeGroup control panel and you are shown what is currently being shared with the Homegroup and you can change several settings, including the existing password. You can type a new password or press the button to generate a new random password. The new Homegroup password is shown.

2: How to create a HomeGroup in Windows 7

You can join a homegroup on a PC running Windows RT , but you can't create a homegroup or share content with the homegroup. "Find devices and content" must be turned on for HomeGroup to work. After you create a homegroup, the other PCs running Windows 10, Windows , Windows RT , or Windows 7 on your network can join it.

Can you check and make sure all these services are set to auto in services. Click Start and type Services. Then check if the following services are started: Here are the most popular reasons for not being able to connect to your HomeGroup. Your computer might not be connected to the network the HomeGroup is on. Try having Windows 7 troubleshoot the Internet connection for you. Your network location might not be set to Home. Learn how to check and change your network location if needed. Network Discovery might be turned off. Learn how to turn Network Discovery back on. Other computers in the HomeGroup might be turned off. Other computer in the HomeGroup might not be sharing files. Learn how to share files using HomeGroup. Once all computers in your home join the Homegroup, you can easily share your documents and printers easily between Windows 10 and other computers. Tony switched to blogging as a passion blended business in the year and currently operates several popular web properties including IndiaStudyChannel.

7: How to Set up a Network Homegroup: 8 Steps (with Pictures)

How to Set up a Network Homegroup One of the features that come standard with Windows 7 is the capability to share documents, images, videos, and music over a home network. HomeGroup is relatively easy to set up and can be useful when working with multiple computers.

What is the Homegroup and how does it work? The idea behind the Homegroup is simple: In this article we will explain how the Homegroup works, how to create one, how to join a Homegroup and how to recover its password in case you no longer remember it. What is a Homegroup? The Homegroup is a group of Windows computers and devices connected to the same LAN or local area network, that can share content and connected devices with each other. For instance, computers that are part of the same Homegroup can share pictures, music, videos, documents and printers with each other. What is shared with the Homegroup is not available to other computers which are on the same network but which are not part of the Homegroup. When you create or join a Homegroup, you can choose what libraries you want to share. After the initial configuration is done, you can select specific folders from your libraries that you do not want to share. And, you can also share other folders and files, or new libraries, others than the defaults. The Homegroup can be created or joined by Windows 7, Windows 8. How to configure Windows so that you can create or join a Homegroup Each time you connect your computer to a new network, Windows 7 asks you to select the type of that network. If you select "Home network" , it means you are in a trusted network of computers, and Windows 7 allows you to use the Homegroup feature. In Windows 7, the Homegroup is not available for Public or Work networks. In order to be able to join a Homegroup later on, you must select "Yes, turn on sharing and connect to devices". In Windows 10, just like in Windows 8. Now that you have set up your Windows 7, Windows 8. What is the Network and Sharing Center in Windows? Then, click or tap on the appropriate search result. In it, you will see the network you are connected to, its type and whether you have already joined a Homegroup or not. If there is no Homegroup in your network, you will see a line which says "Homegroup: If a Homegroup was created by another PC or device in your network, the same line will say "Homegroup: If your computer or device is already part of a Homegroup, the line will say: If you have joined a Homegroup and you want to create another one, you need to first leave the current Homegroup and then create another one. All computers and devices that are part of that Homegroup need to do the same. Then, only one of them creates the new Homegroup and the others join it. Alternatively, you can open the Homegroup window and start from there. If you are using Windows 10, in order to open the Homegroup window, you can also use Cortana to search for homegroup , and then click or tap on the appropriate result. In the Homegroup window, click or tap on the "Create a Homegroup" button. The "Create a Homegroup" wizard starts and show you some information about this feature and the way it works. Click or tap Next. Now you are asked to select what you want to share with other Homegroup members. At this step, you can share only your libraries, printers and devices. You will be able to share other items later on, using the Sharing Wizard. Set what you want to share from the start and click or tap Next. After a couple of seconds, the Homegroup is created and Windows generates a random password that other computers and devices can use to join your Homegroup. Click or tap Finish and you are taken to the Homegroup window, where you can further configure the way this feature works. How to change the Homegroup password Changing the password of the Homegroup can be done by any user from any computer that has joined it. Unfortunately, if you change the password after other computers have joined it, you will have to retype it on all of them and have them join the Homegroup again. Therefore, it is best if you change the Homegroup password as soon as you have created it, prior to joining other PCs and devices. To change the password, open the Homegroup window. In the "Other Homegroup actions" section, click or tap "Change the password". The "Change Your Homegroup Password" wizard starts, asking what you want to do. Click or tap "Change the password". By default, Windows will generate a new random password. Delete the newly generated password and type your custom one. Make sure it is at least eight characters long, so that Windows accepts it as a valid password. Then, the wizard will notify you that the password was successfully changed. Click or tap Finish and you are done. Where to find your Homegroup

password If you want to add another computer to the Homegroup but you forgot the password, you can access it very easily. Use one of the PCs that are part of the Homegroup. Go to the Homegroup window and look for the "Other Homegroup actions" section. Click or tap the link that says "View or print the Homegroup password". The password is now shown in a yellow box. You can either write it down or print it by using the "Print this page" button. When done, close the window.

How to join a Homegroup in Windows Once the Homegroup has been created and the password has been set, it is time for other PCs and devices to join it. Go to the other computers you want to join and open the Network and Sharing Center. Click or tap the line that says "Homegroup: Alternatively, open the Homegroup window and click or tap "Join now". The "Join a Homegroup" wizard starts. It is time to select what libraries and devices you want to share. Then, you need to type the Homegroup password and click or tap Next. They store and sync your settings, including the Homegroup password. Therefore, the password is automatically entered for you. Then, you are notified whether the computer has joined the Homegroup or not. Repeat this procedure on all the other computers and devices that you want to join the Homegroup. There you can view all the Microsoft accounts used on the network, the computers on which they are used and what they are sharing with the Homegroup. In Windows 7, open Windows Explorer and go to the Homegroup section. There you can see each user account used on each of the computers that are part of the Homegroup and what they are sharing. Double click or tap on any of them to view their shared files, folders and devices. The Homegroup will handle the access for you.

How to leave a Homegroup in Windows If you want to leave the Homegroup, you first need to open the Homegroup window. Then, click or tap the "Leave the Homegroup" link, found in the "Other Homegroup actions" section. The "Leave the Homegroup" wizard opens, asking what you want to do. Click or tap "Leave the homegroup". After a few seconds you will receive a notification that the procedure was finished successfully.

Conclusion As you can see, the Homegroup simplifies sharing a lot. Give it a go and let us know how well it works for you.

8: create a homegroup - Microsoft Community

Hi, If you don't have IPv6 Support you will not be able to use HomeGroup though you can use a WorkGroup. Update the network drivers. Both computers need to have unique names.

9: How To Create A Windows 10 Homegroup

HomeGroup is a networking feature of Microsoft Windows introduced with Windows 7. HomeGroup provides a method for Windows 7 and newer PCs (including Windows 10 systems) to share resources including printers and different types of files with each other. Select the types of resources on this PC to be.
