Download You can easily create a professional-looking website with nothing more than an ordinary computer and some raw ambition. Want to build a blog, sell products, create forums, or promote an event? This friendly, jargon-free book gives you the techniques, tools, and advice you need to build a site and get it up on the Web. The important stuff you need to know: Use styles to build polished layouts. Find a reliable web host and pick a good web address. Learn free tools for creating web pages and tracking your visitors. Make sure people can find your site through popular search engines like Google. Encourage repeat visits with social media. Bring in the cash. Include audio, video, interactive menus, and a pinch of JavaScript. These browsers have a simple but crucially important job: This chapter will introduce you to HTML. As you learned in Chapter 1, you need to know two things about every new element you meet: Is it a container element or a standalone element? Is it a block element or an inline element? The answer to the first question tells you something about the syntax you use when you add an element to a document. The answer to the second question tells you something about where you can place an element and how a browser will position your content. When you build a page, you build its HTML framework first, using block elements. Each block element is a distinct chunk of content, and browsers automatically separate block elements from one another. Inline elements are for smaller bits of content, and they can slip seamlessly into another block element, with no extra spacing. When a browser displays the page, you might expect to see both the heading and the text on the same line. The paragraph of text starts on a new line, as you can see in Figure In an attempt to talk less about formatting and more about structure. HTML5 proposes some new terminology. It suggests that inline elements be called phrasing elements and block elements be called flow elements. The goal is to emphasize the difference in the way you can use and place these types of elements, while downplaying the way they affect formatting. The answer is found in another standard: Next, you create a separate document using the CSS standard. This document is called a style sheet, and it defines how browsers format the different elements in your HTML document. First, you can reuse the same style sheet for all your web pages. Because getting your formatting right can be a long and tedious chore, this is a major timesaver. Professional coders sneered at it. However, JavaScript had simplicity on its side. And you never need to install JavaScript or configure it â€” it just works. That makes it the safe choice for any type of site, from an ecommerce storefront to a FreeCell clone. These days, when big companies create web applications, they use one of a variety of server-side programming platforms including ASP.
