

1: Do You Know What You Look Like? | HuffPost Life

Meme Status Confirmed Year Origin FARK Tags look, clothing, how, accessories, survey, perspective, looks like, fashion About. What You Think You Look Like vs. What You Actually Look Like is a two-pane image macro series illustrating the discrepancy between one's own self-image and outside perceptions of physical attractiveness.

That photos show you just the way you are. You could be a fitness model or look like the bottom of a garbage can. But most of us tend to fall somewhere near average. And, for us, the difference between a bad and good picture can be genuinely consequential to our professional and dating lives. I want to know this about me! Read on to learn 5 ways that pictures skew reality. More than likely, you were correct. Camera distortion is ubiquitous in social media pictures especially selfies. The most common cause of camera distortion is that the subject is too close to the lens. Most photographers say that the type of lens used also has a lot to do with it, and wide-angle lenses like the ones in our camera phones are big offenders. A picture is 2D. This difference can have major implications. Without that extra dimension, in photos, a human arm can look way smaller or larger than it really is. For this reason, professional models learn to manipulate their body shape by moving parts of themselves closer or farther from the lens. Photographers have long been known to note the difference between the on-camera and off-camera appearances of famous models. Kate Moss, for example, has been rumored to look quite ordinary in the flesh. Not that I can personally confirm or deny. Our cameras are not as amazing. They can be adjusted to focus on highlights or shadows, but never both at once. Another quirk of how we see in real life is about focus. What results is that pictures look cluttered, distracting, and crappy compared to what we had seen through our own two eyes. Even when their physical features were presented accurately? It was the lack of movement at play. But you miss all of this in photos. As a consequence, sometimes we get photos of ourselves that are much worse than what we really look like! Remember the Beyonce Super Bowl pictures debacle of , anyone?

2: What You Think You Look Like vs. What You Actually Look Like | Know Your Meme

Unless you could take them out and then turn them back towards yourself, you are reliant on reflections, photographs, what you can see when you look down at yourself and what feedback you get from others about how they see you.

This subreddit was inspired by this thread and more specifically, this comment. Top level comments must contain a genuine attempt at an answer All direct answers to a post must make a genuine attempt to answer the question. Joke responses at the parent-level will be removed. Follow-up questions at the top level are allowed. Please do not answer by only dropping a link and do not tell users they should "google it. Users are coming to NSQ for straightforward, simple answers or because of the nuance that engaging in conversation supplies. No responses being rude to the questioner for not knowing the answer. On-topic follow up questions are allowed. Link only answers permitted if the question happens to be "What is a good subreddit for? Other questions not asked in good faith - such as putting a rant or hate towards any group in the form of a question. Any questions we suspect of being leading questions or asked merely to promote an agenda or sealioning will be removed.

3: How do we know what we really look like?

We kindly ask you to use the app only, if other users will not be affected adversely. You are an artist's favorite muse! Take a look at your result to see your beautiful portrait!

By Catharine Paddock PhD If you and your family are planning to spend some of this summer by the sea, by the pool, or perhaps even a river or lake, perhaps you should ask yourself, would you be able to spot someone in trouble in the water, in time to save their life: Mario Vittone , a writer on maritime safety, tells a story about a former life guard, now a boat captain, who spotted a potentially fatal incident from fifty feet away. The captain jumped off his own boat, and sprinted toward a family swimming between the beach and their anchored boat: Many of us, who have perhaps unwittingly been coached by TV dramas and cartoon films, when asked to describe a drowning person would probably say they would be thrashing their arms about wildly above their heads and making loud cries of help. But the reality is that a person who is drowning is more likely to remain quiet, unnoticeable, and sink silently. According to the US Centers for Disease Control and Prevention CDC , in , there were 3, fatal unintentional drownings in the US, an average of ten deaths a day, with more than 1 in 5 victims of fatal drowning being children aged 14 years and younger. Plus, for every child that drowns, four others receive emergency care for nonfatal injuries related to submersion. This is what we commonly assume drowning looks like. However, the actual signs of drowning are very different. Furthermore, says the CDC, many parents have watched their child drown without realizing what was happening. Pia says it is what people do to avoid suffocating in water: Quite different to what many of us might expect. Pia and Vittone make these points about the Instinctive Drowning Response: In the vast majority of cases, drowning people are physiologically incapable of calling out for help because the human body is wired to give priority to the primary respiratory function, breathing, and not to speech, which is a secondary overlaid function. When we are drowning, our natural instinct is to press our arms outwards and downwards onto the surface of the water so we can leverage our bodies upwards to catch our breath. Waving arms about to draw attention is a voluntary movement: These points echo an important rule one learns in basic first aid training and life saving: You go to the silent ones first, in case they are unconscious and unbreathing, in which case they are the ones in more urgent need of life saving help. Vittone also says parents should be aware that children playing in the water usually make a noise: He also lists a number of signs that can help us notice when people might be drowning: According to the CDC, most unintentional drownings of very young children in the US occur in residential swimming pools, and one of the major factors is lack of barriers and supervision. Their records show that most of the young children who drowned in pools in were last seen indoors, had been out sight for less that 5 minutes, and were under the supervision of one or both parents at the time. Having barriers like pool fencing can help stop children getting into the pool area, or at least delay the time it takes them to do that before the adult in charge notices they are gone. Among older children, the dangers tend to be further away from home: Among those that died in boating incidents deaths in , most from drowning , 9 out of 10 of them were not wearing a life jacket, said the CDC. If you are keen on swimming, boating and doing other recreational activities in natural water, it is important to be aware of local weather conditions, and how to interpret the colored flags on the beach. Also, look out for dangerous waves and rip currents. If boating, ensure everyone, no matter how good a swimmer or how far they are travelling, or how big the boat, wears a coast guard approved life jacket. Alcohol is also a problem: Alcohol affects judgement, balance and coordination, and being in the heat and sun while under the influence affects them even more. As Vittone reminds us, drowning does not always look like drowning: But how do you know? So just to be sure, get their attention and ask them, "Are you OK? But if they continue to stare blankly, you may only have 30 seconds to reach them. This video, produced by Mario Vittone, illustrates the signs of drowning. Catharine Paddock Related coverage.

4: 5 reasons A Mirror Can't Really Tell You How You Look Like | 2KnowMySelf

Do you ever sit and ask yourself how you are going Old age comes for us all doesn't matter if you are a ten or a five, rich or poor it will come and get you. Do you ever sit and ask yourself how you are going to look like in your golden years?

However, sperm and semen are actually two different bodily products, though both are related to male reproduction. Semen Sperm and semen are both related to human reproduction. Men produce semen, which contains sperm. Semen also known as seminal fluid is a greyish white bodily fluid secreted by the gonads of men during ejaculation. Sperm is the male reproductive cell, which is what actually fertilizes a female egg. Semen is alkaline, so it protects sperm from the acidity of the female reproductive fluid. Semen also contains fructose, which sperm use for energy as they swim up through the female reproductive system searching for an egg to fertilize. Healthy semen is viscous, grey-white in color, and easy to see with the naked eye. Sperm, on the other hand, is tiny. From head to tail, sperm cells are about 50 micrometers long – much too small to see with the naked eye. Sperm cells are made of three basic parts: Sperm are carried in semen and then swim at a rate of about 8 inches per hour in search of egg cells after ejaculation. Sperm cells actually contain the genetic material to fertilize an egg. Sperm cells are tiny – much too small to be seen by the human eye. Men produce a ton of sperm – and they release a lot of them during ejaculation. Semen is the grey-white liquid released during ejaculation. One millimeter of semen normally contains millions of sperm cells. However, the majority of semen is made up of glands secretions, which protect the sperm from the acidity of the female body and give the sperm cells energy for their arduous search for the female egg. Semen is first ejaculated as a gel and liquefies later. Semen begins as gel and takes up to 60 minutes to turn liquid. Here are three signs that something may be wrong with your semen. Problems With Ejaculation Problems with ejaculation are one of the leading signs that something may be wrong with your reproductive system. Problems ejaculating can be caused by a number of things, such as retrograde ejaculation when semen goes back into the bladder , or medication some anti-psychotics can cause ejaculation disorders. Discolored Semen Semen should be grey-white in color. Any changes to the coloration of your semen can be an indication that something is wrong. Yellow or green semen can be an indication of an infection, such as an STI. Red or brown semen can be an indication of blood in your prostate or other part of your body. Both conditions are serious and should be checked out. Swelling of the Testicles If you notice a lump or swelling of your testicles, you may have a problem that affects your semen, and, by extension, your fertility. The Bottom Line Sperm and semen are both related to human reproduction. What does healthy sperm look like? Sperm are the egg-shaped swimmers that fertilize eggs. What does semen look like? Semen is the viscous grey-white fluid that protects sperm on its long swim.

5: Quiz - What do you look like? - www.enganchecubano.com

How Well Do You Know Yourself? How well do you really know and understand your own mind? Believe it or not, not everyone does. Most people like to think they are a certain way, even if they're not.

The main problem with self image is that you can never really see yourself the way others do. Contributors control their own work and posted freely to our site. If you need to flag this entry as abusive, send us an email. It is based on many factors and is often fraught with problems. This is simply due to the fact that your eyeballs are inside your head. Unless you could take them out and then turn them back towards yourself, you are reliant on reflections, photographs, what you can see when you look down at yourself and what feedback you get from others about how they see you. None of that is the same as actually seeing yourself. For whatever reason, our self image tends to get set somewhere along the way even though we continue to change. We learn about who we are from the adults who raise us, our classmates in school, our neighbors, extended family, friends and the media. Our self image forms as we get feedback from all those sources and as we compare ourselves to others. It seems that we decide very early what adjectives describe us: When your self image differs from who you are today, it can cause you problems. This comes up often in my work with compulsive over-eaters who lose and gain large amounts of weight. If your self image is that of a fat person, and you lose lbs. The same goes for gaining weight if you have always been thin. You may be in denial that you are heavy if you see yourself as a thin person. This image issue also comes up in relation to our aging process. It is difficult to see our own aging as we have always been young. To be happy, I believe the more accurate our self image, the better. For example, if I am overweight, but in denial about it, I have to work to keep the denial going. I might avoid shopping for clothes, weighing myself, crossing my legs, pool parties, etc When someone wants to take photos I might hide in the back. If you want to change something, you have to face it. Face it to change it. If I want to change my weight, I first have to admit that there is a reason to change it. I have to face it. If I want to look younger, I have to admit that I look older. So how do you face yourself when you can never really see yourself? Photographs are one way to see yourself, but they can be deceiving. The wrong angle, odd lighting, etc Video is better because you can see yourself in motion, as others usually see you. Trying on clothes in a dressing room that has angled mirrors that allow you to see your back and side is an excellent way to see yourself. So, go check yourself out. If you are happy with what you see, fantastic. If not, then you can make changes. Either way, having an accurate self image will serve you well.

6: What Ethnicity Do I Look Like? - ProProfs Quiz

If you don't like a scar on your face for example then you are very likely to see it bigger than its really is when you look in the mirror. The same happens when you dislike any of your facial features, you just see them in totally different way than the way others see them.

7: How do I look to other people? : NoStupidQuestions

You can't know for sure, since a lot of how you perceive yourself has nothing to do with what you actually look like. Anorectics, for example, have no abnormalities in judging the appearance of other people, but are grossly off the mark when judging their own appearance.
