*Providing an integrated, modern approach to databases, Databases Illuminated, Third Edition is the essential text for students in this expanding field. The text is packaged with a full suite of instructor resources, including a Test Bank, Solutions to Projects and Exercises, Lecture Slides in PowerPoint format, and Additional Projects.*

MySQL Resources The Databases Illuminated, Second Edition Student Companion website contains material that enables you to get the most out of each chapter in the textbook and to extend your knowledge with additional topics. Features that can help you to learn are lab exercises for many chapters that reinforce the material presented in that chapter, executable code for the examples in the book so you can try them out as you read along, a completely-worked out sample project for a database for an Art Gallery created step-by-step to correspond to the chapters in the text, and step-by-step student projects that follow the sample. The project steps and labs are coordinated with the chapters that cover the corresponding material. Hands-on lab exercises are provided for many chapters, as indicated by an icon at the end of the chapter in the text. They cover the use of Access, Oracle both strictly relational and object-relational aspects, as well as user authorization, transaction management and analytic functions, diagramming software, and InterSystems Cache an object-oriented DBMS available for free download. For Chapter 1, there is a folder with a database file and two lab tutorials, with versions for Access, , and In the first, you use the Access UniversityDB database that is provided in the file, and follow the steps of the tutorial to explore tables, write queries, and do a simple report. In the second, you create an Access database that is fully described in the lab, populate it, and write queries, create an input form, and write a report. Chapter 2 lab exercises require exploring diagramming tools and project management software, including a Gantt chart. A lab for Chapter 3 covers using a drawing tool to draw E-R diagrams. Both of these labs can be done with the drawing tool in Word, if no diagramming tools such as Visio are available. The Chapter 4 lab presents an E-R diagram and asks you to map it to a relational schema and create a working Access database for it. This allows you to see your design in action, and to spot any mistakes you may have made in your design or implementation. Two Chapter 5 labs introduce you to using Oracle, which you can download for your own use freely from the Oracle website. The first requires you to use a script provided in a file to create and populate the University database for the example used in the text, and then to write SQL queries for questions provided in the lab exercise. The second directs you to run a script to create a database for the example used in the end-of-chapter exercises, and to write and execute 23 queries that provide a good drill in SQL. Chapter 7 has a lab exercise in creating a UML diagram for an object-oriented database, and three tutorials on using InterSystems Cache, which you can download free from the Cache website. The tutorials are step-by-step implementations of the corresponding part of the Sample Project, and include practice in creating a web-based input form. The Chapter 8 lab exercise calls for you to create an EER diagram for an object-relational database. In the Chapter 9 lab, you can explore and use the Oracle authorization system, using a database you create from a script. A lab on transaction management in Oracle is included for Chapter 10, with executable code that illustrates rollback, commit, transaction naming, savepoints, and isolation levels. Additional labs will be created and posted to this website. The Sample Project is a unique feature of this text. It provides you with a working example of how you should design and create your own database for the student project you have chosen. At the end of most chapters in the text, you will see an icon that tells you that there is material on-line for the Sample Project and Student Projects. The Sample Project on the website is divided into files by chapter. You should look at the files for the chapter you have just finished, and read the sample carefully, observing the design steps and any code written for the sample, including trying out the code. The code is provided separately in a textfile so you can run it. Then open the Student Projects folder and find the files for the corresponding chapter. They call for the same steps as those you just saw for the Sample Project. Using the Sample Project as a guide, you complete the same steps for your own project. Whenever code appears in the text, if there is an icon saying that the code is available online, you should check the companion website folder called Downloadable Code, and open the folder for the chapter you are reading. The filenames indicate what figures or examples are contained in them. By executing

the code while you are reading the text, you see how the examples work, and you can experiment with the code yourself. There is additional material not included in the text on the companion website. This includes a folder with three appendices and a folder with extra material for Chapters 4, 6, and Appendix A covers physical data organization, including file organization and data structures used for databases. You should read this material if you need a brief introduction to, or a review of, these topics. Appendix B covers the network model and Appendix C covers the hierarchical model. These models are rarely used today, but many legacy databases exist that use them. The material for Chapter 6 presents a more formal treatment of normalization than that found in the text, and higher normal forms. For Chapter 14 there is a document with links to ethical standards for computer and software professionals from the Association for Computing Machinery website.
