A feature not found on a touch screen is that the cursor follows the pen if it is held within about 1/2" from the tablet, but doesn't "act" until you actually touch the surface. The positioning is either absolute (the same spot on the table moves the cursor to the same spot on the screen) or relative (mouse-like).

Applications Top 25 touchscreen apps for Windows 8 Windows 8 already has more touchscreen apps than you might at first expect. Take a look at some of the best. For users, that means many familiar desktop applications do not have a touchscreen equivalent yet. Despite this, Windows 8 has more touchscreen apps than you might at first expect. Most have double-width live tiles that are twice the size of normal tiles, making them great for providing detailed notifications directly to your Start Screen. It has a double-width Live Tile showing you the most read stories, and its main screen allows you to set the news categories most relevant to your interests. This app has a double-width live tile showing previews of the latest stories, feeds and folders can be pinned too. You can also add your unread count to the lock screen. Its double-width live tile, which displays upcoming astronomy events, will make sure you never miss the next meteor shower. Wikipedia -- Free This Windows 8 touch iteration of the collaborative encyclopedia saves you resorting to your browser and integrates with the search and Share Charms the slim bar of icons that can be dragged in from the right. It presents information in a similar format to the desktop website, but text is shown in columns which you scroll across horizontally. The official CNET app mixes news, editorial, video and reviews all into one place. All the product categories are just a right-click away, or a swipe from the top bezel on touchscreens. The key benefit of the Windows 8 app is that it can automatically change the lock screen wallpaper. The app also links directly through to the APOD website, so you can read about the daily image. With its Windows 8 app you can watch live telly without using a browser. Its double-width live tile lists your most watched shows, and you can pin individual channels to the top. Videos can be streamed and downloaded in high definition. The main page of the application has sections for your subscriptions, trending, recently featured, most shared, most popular, favourites and watch later videos. Kindle -- Free This official Kindle app will be familiar to anyone who has used the Kindle Web service. The app allows you to stream books from the cloud or download to your device. Tapping the Kindle Store heading will launch your Web browser, though. When you click on the bid or buy buttons though, the app will launch the relevant eBay page in your browser. Skype -- Free The touch version of Skype is attractively designed and supports instant messaging, plus voice and video calling. It has a double-width live tile that shows the last instant message you received. This version of Skype is still a work in progress, and so is missing the ability to transfer files, and the notification system is inconsistent. TweeterLight is a new Twitter app that fills your screen with tweets. The app still needs some work, but it already stands head and shoulders above the rest. Clipboard -- Free There are several clipboard managers available for Windows 8 touch, but only Clipboard integrates with the Share Charm the. Rather than sending a link or text directly into another app, you can transport it directly to the clipboard for use anywhere. Calculator2 -- Free Calculator2 has several modes -- basic, scientific or business. The app is made to snap into the Windows 8 sidebar, but when in full screen, the right-hand side displays a history of your calculations, which are also shown on its live tile. Windows Phone -- Free Windows Phone is the official companion app from Microsoft and provides a tiled interface for browsing and adding content to your phone, and automatically importing photos and videos. This app lets you upload and download files and view image thumbnails. Google Chrome -- Free Many of us prefer Google Chrome for its cloud sync that lets you view your bookmarks and tabs on other devices. This version of Chrome works in the Windows 8 touch interface, and it can switch into desktop mode when necessary. Again, this is a PC only touch app. CodePlus brings exactly the many-hued interface you need to Windows 8. This app splits notebooks, sections and pages into columns, and its text editor has a novel circular menu for formatting control. The app lets you browse the web securely and automatically logs you in to websites and fills in forms. It has a double-width live tile and can show push notifications on the Windows 8 lock screen. It also synchronises with its Windows Phone counterpart. You can play against the computer, or be matched against an online player. Wordament -- Free

Wordament , the perpetual spelling tournament, pits you against hundreds of people all trying to find as many words as possible in a four-by-four grid of random letters.

A stylus or finger presses the outer layer down forcing contact with the inner layer. Resistive touchscreen is the simple and basic touch screen model. A touch screen monitor can be prompted by physical contact; either with a finger or stylus device. In short, the human hand replaces the keyboard and mouse functions. The touch component can be manipulated as well. Multi-touch features allow the user to swipe, tap, zoom and pinch using only their hand. You probably interact with more touch screen monitors then you realize on a daily basis. They can be found just about everywhere: How do they work? The screen is composed of two layers of glass. The layers face each other and they are separated by a thin gap of air. This creates a connection point and produces voltage, which is read on the processing board. That connection point is now simply a high-tech button. Resistive touch screens are used in high volume environments like restaurants and airports due to their durability, water resistance, and low cost. Also they are employed in the video gaming industry. Nintendo uses this type of screen most notably with the handheld Nintendo DS. Capacitive sensing is more complex. The screen is composed of glass coated with a thin transparent layer of Indium Tin Oxide which acts as a conductor. Since the human body is a conductor of electricity as well, the contact creates a distortion in the electromagnetic field that is read as a change in the screen. While this touchscreen is much more precise, it is fragile, as noted by half of all smartphone cracked screens and usually requires skin to screen contact. The benefits of touch screens are discernible. They are more intuitive. There is no need for you to memorize keyboard shortcuts. Physically swiping something away is more instinctual than burying your head down and hammering away on a keyboard for the same effect. You cannot deny the precision of using a stylus; particularly for drawing and art. Touch screens tend to be more expensive as a whole over their non-touch counterparts. Also, there is no need for additional equipment and they eliminate set up time. There is no need for a hard surface to rest a mouse or trackpad on. The downside of touch screens cannot be diminished with a wave of the hand. The natural oils from hands are also a deterrent; unavoidable, but can be battled with a screen protector. Most will say this is a small bump in the road and just requires more screen wipes with a cloth. Gorilla arm is a condition experienced from excessive use of arm and hand movements with a monitor, resulting in fatigue. Most will never experience this, and touch screens are typically not as strenuous to support this phenomenon. Lastly, touch screens have a shorter battery life. They require more energy and use more battery power. They were first mentioned in and invented by E. By , published articles mentioned the benefits of touch screen technology in the air traffic control industry. CERN was next to manufacture a working model in and by , resistive touchscreen was invented. The next logical question is if touch screen technology will completely replace non-touch screens. Most will say no. The danger of gorilla arm, hand oils damaging the surface, and higher cost will deter a large minority of consumers. However, developments are being made daily in the industry. In the near future we will see touch screen technology using other parts of the hand; knuckles and fingernails to control other functions.
