Re: vnx\unisphere admin guide tolinrome Aug 21, AM (in response to dynamox) yeah, I figured thats what they offer instead of a manual, I just couldnt find\like what I was looking for (monitoring luns and storage groups for activity writes etc).

Shaik Mehboob Deduplication Overview Deduplication provides an efficient method to transmit and store data by identifying and eliminating duplicate blocks of data during backups. All data types from Windows, Linux, UNIX operating systems and multiple platforms can be deduplicated when data is copied to secondary storage. Deduplication offers the following benefits: Deduplicate reduces the amount of data How Deduplication Works The following is the general workflow for deduplication: Data blocks can be compressed default , encrypted optional , or both. Data block compression, signature generation, and encryption are performed in that order on the source or destination host. The associated MediaAgent writes the index information to the DDB on the destination storage, and the duplicate data block is discarded. The associated MediaAgent writes both the index information and the data block to the destination storage. Signature comparison is done on a MediaAgent. For improved performance, you can use a locally cached set of signatures on the source host for the comparison. If a signature does not exist in the local cache set, it is sent to the MediaAgent for comparison. The MediaAgent has write access to disk libraries where the data blocks are stored. These blocks might be distributed on the destination storage whose location is tracked by the MediaAgent index. This index allows the blocks to be reassembled so that the object can be restored or copied to other locations. The DDB is not implemented during the restore process. Use source-side deduplication when the MediaAgent and the clients are in a delayed or low bandwidth network environment such as WAN. You can also use source-side deduplication for Remote Office backup solutions. When the signature generation option is enabled on the MediaAgent, MediaAgent-side deduplication reduces the CPU usage on the client computers by moving the processing to the MediaAgent. Global Deduplication Global deduplication provides greater flexibility in defining retention policies when protecting the data. Use global deduplication storage policies in the following scenarios: Deduplication to Tape Silo Storage Deduplication to Tape can copy deduplicated data to tape in a deduplicated format. Deduplication to Tape extends the primary disk storage by managing the disk space and periodically moving the deduplicated data to the secondary storage. Deduplicated data on tape responds automatically to restore requests by copying only necessary data back to the disk library and then restoring the data. DASH Copy uses network bandwidth efficiently and minimizes the use of storage resources.

2: EMC Community Network - DECN: EMC Unisphere Administration Guide Require -- Clariion, Celerra, V

White Paper Abstract This white paper provides an overview of EMC Unisphere, the single management interface for VNX, CLARiiON, and Celerra systems. It discusses all the features in Unisphere and lists the features supported by.

Administration of VNX is performed with the Unisphere graphical user interface (GUI). Administration of the VNX system can also be performed with a command line interface (CLI). File enabled VNX systems use a command line interface to the Control Station for file administrative tasks.
