2: Infections of Leisure : David Schlossberg :

Infectious diseases can be transmitted to humans from birds by one of several mechanisms. In group 1 infections, birds are the natural reservoirs for the infectious agent, which causes illness among them.

In a global climate where engineers are increasingly under pressure to make the most of limited resources, there are huge potential financial and environmental benefits to be gained by designing for minimum weight. With *Mechanics of Optimal Structural Design*, David Rees brings the original approach of weight optimization to the existing structural design literature, providing a methodology for attaining minimum weight of a range of structures under their working loads. He addresses the current gap in education between formal structural design teaching at undergraduate level and the practical application of this knowledge in industry, describing the analytical techniques that students need to understand before applying computational techniques that can be easy to misuse without this grounding.

Infections of leisure Feline friends / Ellie J.C. Goldstein and Craig E. Greene -- Feathered friends / Matthew E. Levison.

Make your yard home to feathered friends To build a better birdhouse, think like a bird Female bluebird with a worm for her newly hatched brood. Photo by Matthew E. Chapman Early spring is a wonderful time to attract birds to your yard. Natural seed sources from last fall have been picked over and used up. Many of the insects that overwinter are still inactive. To make your yard a neighborhood favorite with residents and migrating visitors, keep filling the feeders and providing fresh water, says Wade Kammin, owner of Wild Birds Unlimited. And offer a variety of houses and materials to make your yard home. Location, location, location Place houses away from feeders, says Kammin. Find a quiet spot away from daily commotion. Mount or hang your birdhouse securely to minimize swinging and any possibility of it falling, and where there is sufficient cover from weather and predators. The couple also provides food, water and three houses for wrens and chickadees. Two are in an area that faces, but is not near, their feeders and water sources, says Nelson, and one is fairly close to the front door. Once the brood hatches and leaves, we empty out the nesting material and rinse the house with the hose. Dead trees and branches are prime locations for cavity dwellers. Birds also can chisel out chips for use in nest boxes. Dry grass, twigs, milkweed silk, catkins from cottonwoods and poplars, spider webs, moss and even snake skins provide excellent nesting material for young families, says the National Wildlife Federation at blog. Single-family residence or condo complex? Purple martins live in colonies. Robins and cardinals build cup nests on platforms, shelves and ledges not too far off the ground. Select houses designed to accommodate the types of birds you want to watch. In areas open enough to attract bluebirds, homeowners can join conservation efforts by providing houses with a single, small hole, easy-clip rough-surfaced wood panels inside and out, and a deep interior with a panel that opens for easy cleaning and viewing. Many of the small songbirds common to Springfield neighborhoods are comfortable in a traditional square or rectangle house with a large, slanted roof and a single hole without a perch. The size of the hole and the distance from the hole to the floor inside will determine who moves in. Ventilation holes allow for climate control. Hang a loose ball of raw cotton wound with cotton twine and watch as finches pull tufts and fly to their nests. Do not use dryer lint, synthetic fibers or human hair, says Kammin. One handy way to provide nesting materials is to repurpose a suet feeder. Lightly sprinkle diatomaceous earth powdered siliceous sedimentary rock under the wire to prevent insect infestation. Clean this out and resprinkle after the last babies leave each nest. Familiar friends Birds you fed and watered during the winter are more likely to stay and teach the next generation to feed and bathe in your yard if you provide safe, secure housing. Enjoy the sights and sounds as offspring become parents from year to year at your house. DiAnne Crown is a frequent contributor for Illinois Times.

Feathered friends / Matthew E. Levison. Less common house pets / Bruno B. Chomel. With man's worst friend (the rat) / James G. Fox. Closed due to rabies / Jesse D. Blanton and John W. Krebs.

Nature re-establishes the pecking order. Tiny velociraptors with wings. Devouring defenseless wiggly things and, and nuts, and fish, and, and other birds. They get the early worms. And have you ever watched a chicken eat? Everybody knows that birds are some of the least scary animals ever, right? As mentioned above, even the cutest birds have pointy beaks and talons, and some birds such as starlings fly in flocks of thousands, making them seem like hordes of avian locusts. Many of them are voracious predators, and airborne to boot – just imagine if they were big enough to swoop down on humans and carry them off. One should not forget the terror birds, flightless predatory birds up to three meters tall that once roamed and likely terrorized the Earth. Feathered Fiends can be divided into four categories: Crows, ravens and vultures are almost always portrayed as creepy if not outright evil due to their association with death. Falcons are the most likely birds of prey to receive a villainous role. Smaller birds that attack people in huge flocks. Usually a Giant Flyer preferably a raptor that carries people off in its talons for dinner. And a Kidnapping Bird of Prey like an eagle, condor or vulture will – against all laws of physics – pick up a small dog or child and fly it to their nest. Much like other cute and seemingly harmless animals, some birds are portrayed as evil or dangerous to subvert common expectations. Killer chickens and villainous ducks are probably the most popular variation. When this one is played completely straight, it frequently results in Narm. Note that this is Truth in Television, as some birds such as cassowaries and swans can be surprisingly vicious and even outright dangerous, while others can be indirectly dangerous by carrying diseases like bird flu and psittacosis. Contrast with Noble Bird of Prey. Feathered Serpents can sometimes qualify, though it varies. The Basilisk and Cockatrice definitely do though. Related to Giant Flyer. It featured an unsettling penguin puppet stalking people drinking Bud Ice, plotting to steal their drinks while humming "Strangers in the Night". While looking for a way out of the Forest of Death, the wolves get freaked out by a creepy talking owl that might be a ghost. One of its cryptic pronouncements does turn out to be a clue to the escape route, though. After the gang discover the bones stripped bare by the bugs, if you watch the next shot of the owl you can see the trees through it as it flies away. The evil Raven from Princess Tutu, and to an extent his daughter Princess Kraehe Crow, and the flock of carrion birds that are associated with them. The same Sparrow returns at the end of that season, evolved and looking for payback. Also, the Taillow, which are also very aggressive if their food sources are threatened. Furthermore, they are able to resist electric attacks which should be super effective against them by sheer willpower. Even Pidgey, which is said to be mild mannered, can generate winds strong enough to blow a ten-year-old into the sky. All Murkrows in the series are a species of Jerkasses as their hat. Avirama Redder In Chrono Crusade, Aion first appears by channeling his voice through his familiar – a bald eagle with glowing red eyes. Probably meant to be creepily symbolic, considering Aion constantly cites his motivations as "freedom". In Magical Girl Lyrical Nanoha The Movie First, The Phoenix Monster of the Week from the original series was replaced with a more demonic monster bird, with horns protruding from its body, claws on its wings, and a jagged beak with tusk-like extensions. Alas, while more fearsome-looking, it lasted as long as the phoenix did. Most Bird-type Digimon are heroic or neutral, but the massive Ultimate-level Parrotmon is definitely a fiend, especially in the first movie. Frontier also has a major villain go One-Winged Angel not literally; he has two wings and they are very large. Velgemon named after Hraesvelgr from Norse Mythology is an undead-looking Giant Flyer whose ultimate ability is to simply draw a circle on the ground with his wingtip. Fourteen chronicles the life, times and genocidal schemes of the murderous Chicken George, a half-man half-chicken born from Vat Grown Chicken Gone Horribly Wrong. The Sidri in the X-Men comic book also fit this variant of the trope. Savage Dragon features a villain named Powerhouse who is an avatar of a nature-god. He looks like a humanoid chicken but despite his ridiculous appearance, the hero of the series soon finds that he is a Not-So-Harmless Villain. In one episode of Suske en Wiske, Wiske manages to befriend a cassowary, who then saves her from bandits a couple of times by pulling them into a Big Ball of

Violence. Even the super strong Jerom respects it: Can also be a birdy. Over the course of his career, the Penguin has a variety of birds as weapons: Vladimir Giurescu is a vampire lord with the power to shapeshift into an large and dark eagle instead of bats. The Clan McDuck are rather well-known in Scotland for the terrifying rampages they go on whenever someone is foolish enough to steal even a small coin from them. Then you have Scrooge and Hortense, who are short-tempered even when money is not involved-and Hortense once routed an entire charging cavalry regiment in her berserker rage. The members of the Coot Kin are usually much calmer. The last one to bear the name, Elvira, better known as Grandma Duck, owns a blunderbuss and will shoot in defense of her home and family. Huey, Dewey, and Louie are nowadays rather nice. This is after Donald took them in and re-educated them, in their early days they were such pests they sent their father to the hospital with a prank why Donald had to take them in in the first place: The latter runs in the family: At one point, they switched foes. Fan Works A Growing Affection has the Shadow Roc, a giant demon bird large enough that all nine Bijuu could fit on its wings, but still not quite as powerful as the One-Tails. Their names are all based on birds and stuff. Spring soon here in Australia and that means swooping magpies. Being made of carbon nanotubes, they even move like birds. Ami worries about the possibility when she disturbs some crows: A group of crows cawed in surprise when a sinister presence joined them on top of the inaccessible rock spire that served as their nesting grounds. Ami briefly tracked them with her gaze, worried that they would come back to defend their nests. However, he is largely no joke in battle considering he is genuinely threatening with his blades when he fights hand to hand. The crow mounts ridden by Mandrake and his warriors in Epic. Which devour him alive at the end of the film. The owl is a downplayed example. Which, from the point of view of a bug are probably the equivalent of Godzilla. The Lost Empire had Pyreflies. The seagulls from Finding Nemo. Puss in Boots features a giant goose known as the Great Terror. Quest for Camelot has Bladebeak, the result of Ruber demonstrating the weapon-merging potion with an axe and a rooster. Nigel, the evil, sadistic cockatoo from Rio. Early Man features a giant prehistoric duck that attacks the cavemen protagonists. Later they tame it and use it for a Big Damn Heroes moment. Films " Live-Action The Birds. Oh, god, The Birds. Could be seen as the Trope Codifier. Vicious man-eating songbirds in Barbarella. Extinction had a whole flock of infected crows attack the convoy at one point. One of the monsters in The Mysterious Island is a terror bird.
