

1: What causes black spots in my vision? | Eye and Vision - Sharecare

Imagination or vision. There is a difference between imagining something in your mind with your eyes open and actually seeing a vision with your eyes open. Our.

Outlook Seeing stars or flashes in vision may be alarming, especially if it has never happened before. The stars may look like fireworks, lightning bolts, or camera flashes. An isolated flash of light is usually harmless. However, if seeing stars becomes frequent or is severe and sudden, a person should speak to an eye doctor right away. How does seeing stars work? A person typically sees stars because of a disturbance in the retina or the brain. The retina is a lining of cells that sits at the back of the eye and sends messages to the brain when it detects light. The retina does not see colors or shapes; it only sees light. A special gel called the vitreous sits in front of the retina to protect it. If the retina gets inflamed, or the vitreous gel moves around or shrinks, the retina will be stimulated and send signals to the brain. The brain interprets these signals as light, even if no external light source exists. If something disrupts electrical activity in the brain, it may send false signals, making a person think they see stars. Causes The following are the most common causes of disruptions in the brain or retina that could lead to seeing stars: A blow to the head A blow to the head may lead to seeing stars. Cartoons have portrayed this phenomenon for years: The brain is protected by a layer of fluid that usually prevents it from hitting the inside of the skull. A hard knock, such as from a sports collision or car accident, however, may result in the brain bouncing against the skull. The back of the brain contains the occipital lobe, which is the part of the brain that processes visual information. If this area is knocked, it sends out electrical signals that the brain thinks are light. Getting hit in the eye can also cause flashes of light because it bumps the retina. The retina is stimulated and sends light signals to the brain. Gently rubbing closed eyes is one way to experience this phenomenon without injury. Migraines Migraine headaches can cause changes in vision, including seeing stars, sparkles, or flashes. They can also cause spots, heat-like waves, tunnel vision, or zigzagging lines. These changes occur in both eyes and are thought to be caused by abnormal electrical signals in the brain. If these visual changes occur before a headache develops, it is called migraine with aura. Some people who get migraines may also experience the aura without a headache afterward. A retinal migraine is a different type of headache that causes visual changes in one eye only. This is a rare condition and can be a symptom of something more serious. Like a migraine with aura, the visual changes happen before the headache hits. The visual changes may include seeing stars, flashes, or dark spots, as well as temporary blindness. Retinal disturbances or decreased blood flow to the retina may cause these symptoms. It is essential for people to contact a doctor right away if they experience retinal migraine symptoms. Other typical migraine symptoms include:

2: 6 Causes of Double Vision (Diplopia) or Ghost Images

is that vision is (label) the sense or ability of sight while seeing is the action of the verb to see ; eyesight. As verbs the difference between vision and seeing is that vision is to imagine something as if it were to be true while seeing is.

A mystical, extra-dimensional police officer, The Vision was published by Marvel predecessor Timely Comics during the s and s, a period which fans and historians call the Golden Age of Comic Books. Decades later, editor Stan Lee and writer Roy Thomas decided to add a new team member to the superhero-team series The Avengers. Thomas wanted to bring back the Golden Age Vision, but Lee was set on introducing an android member. Thomas ultimately compromised by using a new, android Vision. Thomas wanted the character to be white as befitting his ghostly name, but printing limitations of the time would have rendered him colorless, with un-inked paper where his skin should be. He settled on red as he did not want Vision to be green like the Hulk or blue like the Atlanteans. Thomas recounted, "I felt that a romance of some sort would help the character development in The Avengers, and the Vision was a prime candidate because he appeared only in that mag So they became a pair, for just such practical considerations. It was finally followed up in The Avengers " This was followed by a second volume numbered 1 "12 Oct. Journalist Karen Walker later commented, "This image alone has probably done more to shape how future writers and readers perceive the character than anything before or since. Nearly a decade after that came a second four-issue volume Oct. Vision appeared as a regular character in the " Avengers series, from issue 19 January through its final issue 34 January The Vision again appeared in a solo series, Vision, with 1 that started in November and ended with 12 in October Fictional character biography[edit] Debut of the Silver Age Vision: The Avengers 57 Oct. Cover pencils by John Buscema. Ultron sends his new servant to lead the Avengers into a trap. The Wasp is the first to encounter the synthezoid, and describes it as a "vision" while trying to escape. Adopting the name, the Vision is convinced by the Avengers to turn against Ultron. This was part of his plan to nurture a relationship for the Scarlet Witch that would prevent her from having any children, as her power level meant that any offspring she might have could threaten the cosmic beings of the Marvel Universe. He eventually regains control of his body and becomes team leader. The Avengers recover the parts, and Dr. Pym rebuilds the Vision, but with a chalk-white complexion. The twins are absorbed back into Mephisto, which temporarily drives Wanda insane. Although she recovers, Wanda and the Vision separate, each operating on a different Avengers team. Remaining a member of the Avengers, he briefly becomes romantically involved with teammates Carol Danvers a. Marvel and Mantis before attempting again to reconcile with the Scarlet Witch. This causes a series of catastrophic events that includes the Vision crashing an Avengers Quinjet into Avengers Mansion. The Vision advises his teammates that he is no longer in control of his body, and then expels several spheres that form into five Ultrons. The Avengers destroy them, and an enraged She-Hulk tears apart the remains of the Vision, having been driven to a breaking point by the rapid slew of attacks against the Avengers. Doom forced Scarlet Witch to send Vision against her teammates. He then goes to Utopia to confront Magneto , threatening Magneto to tell him where Wanda is. Magneto uses his powers to subdue the Vision but spares him, saying he believes Wanda still cares for the Vision and that Magneto does not want to hurt her more. Captain America talks to the Vision afterward, telling him he needs to move forward. X-Men " storyline, Vision claims that her use of his body to attack his friends is something that he cannot forgive and, while he banishes her from the mansion, he also sheds tears after her departure. After departing the team, he is shown visiting Billy Kaplan , the teenage reincarnation of one of his sons. Marvel to leave the team, it is revealed that he is working for Kang the Conqueror as Kang mounts his latest assault on the team, [41] having been contaminated when Kang interfered with his recent reprogramming. In the series, he lives in Fairfax, Virginia with a newly-created synthezoid family: They attempt to live a normal suburban life with Vision working as a consultant to the president, but they find socializing with neighbors difficult. The Grim Reaper attacks their house and nearly kills Viv. Unbeknownst to him, Agatha Harkness has a vision of the future and warns the Avengers that Vision and his family will cause a genocide. Virginia reveals to Viv that she had murdered her classmate. Seeing that Vision would go down a dark path if he killed Victor Mancha, she flies to

the jail and murders Victor herself. Virginia proceeds to drink water with corrosive properties from a Zenn-Lavian water vase they have in their home, and asks Vision to sit with her until the water kills her. Seeing her enables him to free himself of the virus, which spreads to the Hydra Dreadnoughts and shuts them down. In extreme cases he can discharge this same power through the Solar Jewel itself which amplifies its destructive effects considerably, albeit at the cost of losing most of his resources. By interfacing with an unknown dimension to which he can shunt and from which he can accrue mass, thus becoming either intangible or extraordinarily massive, the Vision can change his density, which at its lowest allows flight and a ghostly, phasing intangibility, and at its heaviest, a density ten times greater than that of depleted uranium, [54] which gives him superhuman strength, immovability, and a diamond-hard near invulnerability. On one occasion, the Vision uses this extreme density to render unconscious the villain Count Nefaria; [55] at other times, he thrusts an intangible hand into them and then partially re-materializes it, a process he describes as "physical disruption. The Vision was trained in hand-to-hand combat by Captain America, is an expert in the combat use of his superhuman powers, and is a highly skilled tactician and strategist. The Vision is an expert on his own construction and repair. He can now split himself into smaller parts and change shape. Proctor would wind up switching the bodies of both Visions and have his version infiltrate the Avengers as his mole.

3: Vision (Marvel Comics) - Wikipedia

The most common vision problems are refractive errors, more commonly known as nearsightedness, farsightedness, astigmatism and presbyopia. Refractive errors occur when the shape of the eye prevents light from focusing directly on the retina.

Streaks or specks of light in your vision are described as flashes. They can happen when you bang your head or get hit in the eye. They can also appear in your vision because your retina is being pulled by the gel in your eyeball. One is the result of a blow to your head. This type of injury can scatter nerve signals in your brain and affect your vision temporarily. Something else may be happening inside the eye besides injury. There are various causes for these visual events. In some cases, pregnant women may experience an increased number of floaters, possibly due to high blood pressure or elevated glucose levels. Floaters are tiny, cloudy spots that seem to drift in and out of your field of vision. Sometimes they can be caused by other conditions, including:

The occipital lobe is in the back of your brain. Your occipital lobe processes those signals so your brain recognizes that image as a tree. If you get hit on the head, the tissue in your occipital lobe gets shaken up. Brain cells then send out random electrical impulses, which your brain interprets as flashes of light that may seem like stars. To understand why, it helps to know a little more about the anatomy of your eye. The retina is a thin tissue layer at the back of your eye that is light sensitive. The part of your eyeball directly in front of the retina contains vitreous, a gel-like substance that helps your eye keep its shape. There are also tiny, very thin fibers in the vitreous. When these fibers pull on your retina or the gel rubs against your retina, you may see stars. If your retina gets pulled too hard or moves out of its usual position, the result can be a retinal detachment. This can cause you to see stars. It can also cause you to lose all or part of your vision in that eye. A detached retina can often be treated successfully with surgery.

Migraine headaches One other cause of stars in your vision is a migraine headache. Not everyone who has migraines sees stars or colorful lights which are also known as aura , but many do. These are treated by ophthalmologists or optometrists, doctors specializing in eye health. Traditional migraine headaches, as well as a blow to the head, can give you a lingering pain in your head to go with your starry visions. If a retinal detachment is to blame, you may see floaters along with flashes. A detached retina can also make it seem as though a curtain is being drawn over your vision in the affected eye. But at your next eye appointment, tell your doctor how often you see flashes or floaters. If you start to see more flashes of light, call your eye doctor right away. Risk factors for seeing stars in your vision As you get older, your risk of retina problems and vision impairment increases. You tend to see more floaters as you age too. Contact sports, such as football or soccer, boost your odds of getting hit on the head and shaking up your occipital lobe. Even a mild concussion should be evaluated by a doctor.

4: Vision Synonyms, Vision Antonyms | www.enganchecubano.com

Seeing occasional flashes or stars in vision is usually not an indication of an underlying health problem. Many people find that seeing stars happens only occasionally and that their eyes are.

Introduction 2 A few months ago I was walking across campus at Dallas Theological Seminary, and I saw a blind man making his way across a court yard. He was using a walking stick with confidence, and I stood for a moment and watched him walk just amazed at the resiliency of the human mind. Here this guy had basically memorized the layout of the campus, and he walks where he needs to go without seeing a thing. I turned to enter a building when it dawned on me that he was headed for a corner of campus where I knew there was a new construction site. I turned around and wondered if he knew it was there. A few more moments showed that he did not. I ran across the courtyard just as he walked into one of those plastic orange fences that surround these kind of projects. It was obvious he was confused. I explained what was going on, and he asked me to walk him back to the court yard. He could get to where he was going from there. When I asked him where he was going, he said that he intended to walk down the block to the corner. I took a quick look down the block and suggested I walk him to where he needed to go because there was a bucket loader parked in the middle of the side walk working on some power lines. His little walk to the corner would have ended in disaster. These two little balls of fluid nestled into sockets in my head mean the world to me. I think I would rather lose a finger than lose my eyes. These eyeballs are a wonder of engineering. You think your digital camera is complex. Think for a moment about all the parts of your eye: Take a look at the room around you, and notice the colors, notice the seamless way you perceive depth, think about how your eye reacts to light, how it focuses almost instantaneously. It is simply unbelievable what God has made. If you are ever at a loss for things to praise God for, stop and think about your eyes. A Serious Limitation But as powerful as your eyeballs are, they have one significant limitation. Every single eye in this room has a fatal flaw. Your eyes can only see physical reality. Every eye in this room is limited to seeing physical things: These things are all physical, and they are the only part of reality accessible to our eyes. Our eyeballs are completely useless when it comes to perceiving spiritual reality. Purpose of This Sermon I want to try to persuade you that as valuable as your physical eyesight is, you have a set of spiritual eyes that are even more valuable. Not only do you have spiritual eyes, but you must use them if you want to live a life that finds its satisfaction in God. Every human being has spiritual eyes. God gave them to us so that we could apprehend the spiritual realities of life. Sadly, those who have not trusted Christ are completely blind spiritually. Paul wrote in 2 Corinthians 4: But even if our gospel is veiled, it is veiled only to those who are perishing, among whom the god of this age has blinded the minds of those who do not believe so they would not see the light of the glorious gospel of Christ, who is the image of God 2 Corinthians 4: They cannot see unless the Holy Spirit gives them sight. Often our spiritual vision is blinded by the glare of what our physical eyes see. I want to convince you that it is more important to make sure your spiritual eyes can see clearly than almost anything else you do. I want to do that by thinking with you through Psalm Exegesis Psalm 73 is what students of the Bible call an individual song of thanksgiving or a wisdom Psalm. In this Psalm, a single author stands before a congregation of gathered worshipers and gives praise to God for delivering him from some difficult circumstance. The testimony time has multiple purposes. First, the psalmist wants to thank God for deliverance; second, he wants to provide a warning to others about what almost happened to him; third, he wants to encourage his listeners to greater faith in God. Psalm 73 begins with a summary of his theology. Certainly God is good to Israel, and to those whose motives are pure Psalm This statement represents his settled conviction after the trouble he recounts in the Psalm. He states his conclusion here as a preview. The image you should have in your mind is a group of people gathered together for a time of testimony. I almost lost it out there; I almost wasted my life. He says, But as for me, my feet almost slipped; my feet almost slid out from under me For I envied those who are proud, as I observed the prosperity of the wicked Psalm The Wicked in All Their Glory He took those two little eyeballs of his, and he focused them on the proud and wicked around him and what he saw made him envious. Why was he envious? Well, just look at them! For they suffer no pain; their bodies are strong and

well-fed. They are immune to the trouble common to men; they do not suffer as other men do Psalm These people are healthy! If they get sick, they have access to the best medical care. They can afford all the pain-killers they need. They are well fed, they shop at the best super-markets, and eat at the best restaurants. They can afford the best security systems to protect them from the trouble the rest of us have to live with. These people have it made! But their comfortableness is not limited to physical comforts. They are emotionally secure as well! Arrogance is their necklace, Their prosperity causes them to do wrong; their thoughts are sinful. They mock and say evil things; they proudly threaten violence. They speak as if they rule in heaven, and lay claim to the earth Psalm A Striking Caricature Talk about confident. These guys are the epitome of swagger. Because they have so much, they act with impunity, without regard for consequences. They speak their mind, and if they must, they use violence in their negotiations. They think they own the joint and can do what ever they want. Verse 9 is a magnificent caricature. This is an ancient 3 image that describes their insatiable appetites. To make matters worse, everyone likes these people. Not only are these men healthy and wealthy, but they have the adulation of the masses. They are all the rage! The Hebrew here is difficult, but I think the point is that people are attracted to them and are led into a similar lifestyle by them. People follow them and want to be like them. Their behavior emboldens the crowds to reject God as well. Talk about negative examples. So with a cry of protest the psalmist concludes the description of what his physical eyeballs could see. Take a good look! This is what the wicked are like, those who always have it so easy and get richer and richer Psalm A Disturbing Conclusion I say this is a cry of protest, and not a shrug of resignation because the psalmist knows in his heart that something is not right. He recognizes what his eyes are showing him, but he is in conflict because he understands that this is not the way the world should be. His sense of justice, and faith in God, tell him that the wicked should get what they deserve: What the psalmist saw was powerful enough to cause a crisis of faith! This guy is actually questioning his approach to life and is beginning to regret the fact that he has heretofore been committed to a life of purity! Behold the power of what your physical eyes see. Understand that these two little balls of goo stuck in your head are actually capable of causing you to doubt your faith. In verses , you are witnessing the psalmist right on the edge of destruction. He mentioned, in verse 2, that he had almost slipped; well, here it is. His foot is just about to step on the proverbial banana peel. Behold the power of what your eyes see. This is a man in turmoil. What holds him back may surprise you. If I had publicized these thoughts, I would have betrayed your loyal followers. When I tried to make sense of this, it was troubling to me Psalm This man is part of a community. He knows he is not an island.

5: Vision | Define Vision at www.enganchecubano.com

There are several causes of seeing stars in your vision. One is the result of a blow to your head. This type of injury can scatter nerve signals in your brain and affect your vision temporarily.

Refractive errors occur when the shape of the eye prevents light from focusing directly on the retina. The length of the eyeball either longer or shorter, changes in the shape of the cornea, or aging of the lens can cause refractive errors. Refraction is the bending of light as it passes through one object to another. Vision occurs when light rays are bent refracted as they pass through the cornea and the lens. The light is then focused on the retina. The retina converts the light-rays into messages that are sent through the optic nerve to the brain. Nearsightedness also called myopia is a condition where objects up close appear clearly, while objects far away appear blurry. With nearsightedness, light comes to focus in front of the retina instead of on the retina. Learn more about nearsightedness. Farsightedness also called hyperopia is a common type of refractive error where distant objects may be seen more clearly than objects that are near. However, people experience farsightedness differently. Some people may not notice any problems with their vision, especially when they are young. For people with significant farsightedness, vision can be blurry for objects at any distance, near or far. Learn more about farsightedness. Astigmatism is a condition in which the eye does not focus light evenly onto the retina, the light-sensitive tissue at the back of the eye. This can cause images to appear blurry and stretched out. Learn more about astigmatism. Presbyopia is an age-related condition in which the ability to focus up close becomes more difficult. As the eye ages, the lens can no longer change shape enough to allow the eye to focus close objects clearly. Learn more about presbyopia. Presbyopia affects most adults over age 40. Other refractive errors can affect both children and adults. Blurred vision is the most common symptom of refractive errors. An eye care professional can diagnose refractive errors during a comprehensive dilated eye examination. People with a refractive error often visit their eye care professional with complaints of visual discomfort or blurred vision.
