Geotechnical Engineering By C. Venkatramaiah: This book has been designed to meet the needs of the Civil Engineering Curricula for the courses in the subject of Geotechnical Engineering of Indian Universities. The topics have been dealt with in a logical sequence and the concepts explained in a lucid manner.

The specific gravity of solids is 2. Determine its void ratio, porosity, saturated unit weight and dry unit weight. A saturated clay has a water content of Determine the void ratio and specific gravity of particles. The mass specific gravity of a fully saturated specimen of clay having a water content of On oven drying, the mass specific gravity drops to 1. Calculate the specific gravity of clay. A sample of clay taken from a natural stratum was found to be partially saturated and when tested in the laboratory gave the following results. Compute the degree of saturation. From the phase-diagram Fig. All the illustrative examples may be solved with the aid of the soil-phase diagram or the unit-phase diagram also ; however, this may not always be simple. Soil is a complex physical system ; generally speaking, it is a three-phase system, mineral grains of soil, pore water and pore air, constituting the three phases. If one of the phases such as pore water or pore air is absent, it is said to be dry or saturated in that order ; the system then reduces to a two-phase one. Phase-diagram is a convenient representation of the soil which facilitates the derivation of useful quantitative relationships involving volumes and weights. Void ratio, which is the ratio of the volume of voids to that of the soil solids, is a useful concept in the field of geotechnical engineering in view of its relatively invariant nature. Submerged unit weight is the difference between saturated unit weight and the unit weight of water. Specific gravity of soil solids or grain specific gravity occurs in many relationships and is one of the most important values for a soil. G_s , where S represents degree of saturation, e represents void ratio, w represents water content, and G represents grain specific gravity ii Derive the relationship between dry density and bulk density in terms of water content. Sketch the phase diagram for a soil and indicate the volumes and weights of the phases on it. What is a unit phase diagram?
