

1: History of Naugatuck, Connecticut. (Book,) [www.enganchecubano.com]

History. Naugatuck was settled in as a farming community in rural western Connecticut. As the Industrial Revolution commenced, Naugatuck was transformed into a hardscrabble mill town like its neighbors in the Naugatuck Valley.

History[edit] Naugatuck was settled in as a farming community in rural western Connecticut. As the Industrial Revolution commenced, Naugatuck was transformed into a hardscrabble mill town like its neighbors in the Naugatuck Valley. Their Footwear Division manufactured Keds sneakers in Naugatuck from until the s. Rubber also produced Naugahyde in a Naugatuck factory, but it is no longer produced there. Due to an increase in the price of sulfuric acid , which was needed for the process then used for reclaiming old rubber, the United States Rubber Co. Naugatuck Chemical remained a subsidiary of the U. They moved their operations to Middlebury , Connecticut , in the s. The Risdon Manufacturing Company, established in Naugatuck around , began by producing safety pins. Local housewives and children were often hired to attach the pins to cardboard for easy sale. Risdon became the manufacturer of total packaging for cosmetics, personal, household and other consumer products and home sewing notions such as common pins, needles, snaps and other accessories. It is now the Crown Risdon Co. In the s, Harold Barber founded H. Barber and Sons in the community. The company builds beach rakes for picking up debris and grooming beaches and claims to be the largest such business in the world. The normally peaceful Naugatuck River that flows through Naugatuck overflowed its banks on August 19, Town history sign found on the Naugatuck Green As American manufacturing declined in the late 20th century, the mills closed and the town fell on largely hard times. With the expansion of suburbs, especially in New Haven and Fairfield County , the town is now largely a bedroom community for the middle class. Middlebury and Oxford are affluent towns that have higher performing school districts, but the price to live in these suburbs is high. Currently, many new more expensive homes are being built as people from Fairfield County and other areas are looking for more affordable housing and convenient access to major highways. Naugatuck High School c. The local high school, Naugatuck High School , has a storied football rivalry with the high school in Ansonia that is one of the longest in America. Like the other rival high schools in the Naugatuck Valley , the two teams meet the morning of Thanksgiving Day. The first meeting was in Ansonia is the long-term winner in the series. The town of Naugatuck is affectionately referred to as "Naugy" by its residents. Naugatuck is also no stranger when it comes to being in popular media. The town has also been used as a filming location for works such as Engine Trouble , released in , and War of the Worlds , filmed at the former Uniroyal plant and released in The plant was demolished on February 28, Naugatuck has experienced some economic and budgetary problems since resulting from the a recession. Critics point out issues with public employee pensions. Education[edit] Naugatuck has a total of 5 public elementary schools which include grades K-4 , 2 public intermediate schools grades , 1 public middle school grades , and 1 public high school grades Although well funded, many years of mismanagement by the elected Board of Education, has led to this poor rating. In recent years, a mostly new Board of Education and a new Superintendent has helped improve the quality of education in the school district. Government[edit] Naugatuck is unique in Connecticut government for being the only consolidated town and borough. Every other borough in Connecticut is a special services district located within another town , the unit of Connecticut local government. Naugatuck has both a town clerk and a borough clerk managing official records, the same as Connecticut cities having two clerks: As with most other Connecticut towns and cities, Naugatuck elect their officials in November of odd-numbered years.

2: Haunted Places in Naugatuck, Connecticut

The town of Naugatuck, located in New Haven County, spans both sides of the Naugatuck River and lies just south of www.enganchecubano.com *incorporated as a town in 1784, it became, in 1800, the only town in Connecticut that is both a consolidated borough and a town.*

Approaching the split between Routes 8 and 25, the road expands to 6, 8, and even 10 lanes. From Trumbull, it briefly enters Stratford before entering Shelton passing by several exits providing access to business parks. It then crosses the Housatonic River and continues into Derby. After the Route 34 interchange, the road takes on more of a semi-rural character as it winds its way along the Naugatuck River through the towns of Ansonia, Seymour, and Beacon Falls before it becomes more suburban in nature in Naugatuck, and then more urban as it enters Waterbury. After the Route 73 interchange, the road returns to its winding semi-rural nature, passing through Watertown, Thomaston where US 6 briefly overlaps for about a mile, Litchfield, and Harwinton. After a brief suburban section through Torrington where it intersects US and Route 4, it returns to a rural freeway before entering the town of Winchester. After a short 0. It intersects the western end of Route 20 on the northern edge of town, and continues through Colebrook to the Massachusetts state line, becoming Massachusetts Route 8 upon entering Sandisfield. The section from Waterbury to the freeway end in Winchester is known as the James H. The turnpike was chartered in 1800 and collected tolls until 1830. In 1938, the six New England states began a region-wide highway numbering system. The trunk highway from Stratford through Waterbury to the Massachusetts state line became part of the multi-state New England Route 8. The original alignment of Route 8 through Beacon Falls became part of Route 8. This constituted the completion of the freeway from Bridgeport to Winchester, 35 years after construction began. Attempts at Interstate designation[edit] The Route 8 freeway was envisioned to continue beyond its present northern terminus in Winsted to either Massachusetts or southern Vermont. In 1965, Massachusetts and Connecticut requested an interstate designation for the Route 8 corridor that included completed and yet-to-be-built sections in both states. That request was denied by the Federal Highway Administration. In that report, the study noted that not all of the Route 8 freeway meets interstate standards, particularly sections that were designed and built before the interstate highway era. Newer sections between Bridgeport and Shelton, around Beacon Falls, and from the I-91 interchange in Waterbury to Winsted were designed and built from the late 1950s to the early 1970s and either meet interstate standards or require minimal spot upgrades to meet interstate standards. The report noted the sections that do not meet interstate standards include the 8-mile segment from Shelton to Seymour, which was built in stages from the late 1950s through the early 1970s; and the 5-mile section through Naugatuck, which was built in the 1950s. Both of these segments include narrow cross-sections, tight curve radii, and closely spaced interchanges that do not meet current interstate standards. Because these segments wind their way through the urban centers of Shelton, Derby, Seymour and Naugatuck on elevated viaducts, upgrading or bypassing these segments would be costly and cause significant disruption to the surrounding communities. Exits will be renumbered from sequential to mileage-based numbering by ConnDOT starting in 2010.

3: Naugatuck Chemical Company Naugatuck, Connecticut

The Naugatuck Historical Society is an organization keeping the stories of Naugatuck alive and accessible to the public through exhibits, research, and presentations. We maintain and preserve collections for the purpose of inspiring a love of local history and contributing to civic pride.

Org Naugatuck Chemical Company ca. As the Industrial Revolution commenced, Naugatuck was transformed into a mill-town like other cities in the Naugatuck Valley. Rubber was the major product made there. Rubber also produced Naugahyde fabric in a Naugatuck factory, but it is no longer produced there. The company founders recognized that chemistry was the key to make rubber more serviceable. A group of Eastern footwear makers united in to share research and lower costs. Lewis under the first license granted by Charles Goodyear, who discovered the rubber vulcanization process in Due to an increase in the price of sulfuric acid, which was needed to reclaim used rubber at the time, the United States Rubber Co. This company started manufacturing sulfuric acid and was soon in the forefront of the chemical industry in the United States. Benedict was the president, the position he held until ; James B. Ford was vice president; Charles E. Sholes, secretary; and Matthew Adgate, a veteran of acid manufacture, was plant superintendent. Adgate later became vice president. The plant, which was located on Elm Street and the railroad, had 43 buildings on twenty acres along the Naugatuck River. The company manufactured sulfuric acid, nitric acid, muriatic acid, hydrofluoric acid, acetic acid, nitrobenzene, aniline, and antimony sulfides. This was one of the larger concerns of Naugatuck, employing people. Hydrofluoric acid was used for pickling castings and removing sand from brass castings. Nearby Waterbury had large brass mills. The reclaimed rubber unit was partly converted in to the caustic soda process perfected by Raymond B. Price, who joined the company when the Rubber Regeneration Co. He formed a group of Ph. The onset of World War I cut off the supply of aniline, the main rubber accelerator and softener, from Germany. The company quickly hired technical experts and installed equipment to manufacture its own aniline, which prevented the tire plants from shutting down. Thiocarbanilide was discovered as an improved vulcanizer and went into production. The company consolidated various footwear brands under one name, Keds, in Keds were the first mass-marketed canvas-top "sneakers" in Damage from an explosion in the nitrobenzene building No. There was no one in the building at the time, and none of the twenty-five employees at work in other buildings nearby were injured. The explosion was felt in New Haven. During the early s, organic chemical research was expanded. Later, secondary amines such as "BLE" were found to be superior antioxidants. The company succeeded in using liquid rubber latex as a raw material after devising techniques to prevent the latex from spoilage during storage and shipment. Rubber was the first company in the U. This resulted in greatly increased manufacture of pile carpeting and coated fabrics. Another discovery was "Hepteen", an accelerator made from aniline and heptaldehyde. The company invented a continuous thermal-cracking process to make the chemical from castor oil and became the largest producer of heptaldehyde in the world. During the Depression, U. Rubber expanded in rubber chemicals and branched into two related fields: The jasmine odor base, amyl cinnamic aldehyde, was made from heptaldehyde. This launched the Aromatics Division, which generated pleasant scents for soaps and cosmetics. The violet-scented ionones from lemon grass oil were also introduced. The company examined thousands of organic chemicals it had synthesized as potential insecticides and fungicides. An insecticide called "Syntone" was developed, in addition to two fungicides, "Sperguson" and "Phygon", which boosted seed germination and crop yields. Research on textiles led to a chemical treatment that strengthened cotton fibers. The cotton cord called "Ustex" was an improved material for tire fabrics and parachute harness webbing. When the Japanese prevented access to the Far Eastern rubber plantations, U. Rubber developed dodecylmercaptan, which could make rubber of any desired viscosity, from liquid to hard solid. The company operated a government plant that supplied this synthetic rubber modifier during the war. Rubber also pioneered in synthetic rubber production, designing and building one of the first three plants that helped the U. The company also operated TNT plants for the government. Shepard was manager of the Chemical Division staff at Naugatuck. Research activities included research, development, and control work on synthetic rubber, rubber chemicals, aromatic chemicals,

agricultural chemicals, dye intermediates, reclaimed rubber, latex compositions, aqueous dispersions, plastics, lacquers, and high explosives. The manager of the Footwear Division was J. Research activities involved the style, design, construction, compound, and process development for various types of waterproof and canvas footwear. The wartime research on synthetic rubber led to a new line of postwar products. Consumer articles like clock cases and lightweight boats were made from "Vibrin". The Naugatuck Chemical Division had several breakthroughs in the field of chemical blowing agents for expanding synthetic foam products. Loren Schoene in OBSH was the most useful and popular of the sulfonyl hydrazide type blowing agents, especially in the early days of the production of nitrile-vinyl insulation tubing. Azodicarbonamide or ADCA was discovered in This use was reported by an Allied technical investigation team after the war in the B. But when ADCA was tried in the rubber industry, the decomposition temperature of degrees C was too high for use in sponge nitrile-vinyl foam for insulation, flotation and athletic applications. Naugatuck Chemical discovered that glycerol 1,2,3-propanetriol lowered the decomposition temperature. The patent was awarded in This work enabled the use of ADCA in the rubber and plastics industries. The product, "Celogen AZ", was first produced in The technical staff consisted of chemists; engineers: Research was focused on synthetic rubbers, reclaimed rubber, rubber chemicals; plastics polyvinyl chloride, resin-rubber blends, polyesters ; synthetic and compounded latices; agricultural chemicals; aqueous dispersions; heavy chemicals; and solid fuel propellants. Naugatuck Chemical remained a subsidiary of the U. They moved their headquarterw to Middlebury, Connecticut in the s. Most operations at Naugatuck ceased in the late s. In , Avery Inc. In recent years only about 50 people worked at the Naugatuck plant compared to 9, employed at its peak. Until the s, the Naugatuck River was subject to discharges from the cities and industries along its banks. As far back as , when there were few environmental laws, the state Sewage Commission said the river was already polluted to its limit. Smoke and foul odors contaminated the air. In the s the river often changed color from the dyes used to color Keds sneakers. Today, most of the factories are closed, with some sites converted to shopping malls or housing. EPA pollution regulations mandated pollution controls on municipal and industrial discharges, and the closure of the factories helped the Naugatuck River recover. Wildlife has returned and there are no health warnings for the entire mile length of the Naugatuck River watershed. Former employees who would like to share their experiences working at this plant can contact the author by clicking the Contact link below. Trade Ad U. Rubber Plant in Naugatuck, CT in Note Piles of Used Tires in Foreground. Most of the remaining buildings were demolished in In the 28 minute film, shot in Naugatuck, a retired "rubber man", first hired in , touts the many consumer uses of rubber to his grandson. There are scenes of rubber manufacturing, rubber plantations, even downtown Naugatuck and the old Naugatuck High School. The acting is not Academy Award caliber, but the film is representative of the industrial film genre popular in the s. The audio quality of the musical soundtrack is poor but the dialogue is clear.

Expert advice Handy directions on how to craft an outstanding dissertation Composing an outstanding dissertation requires many months of hard work and toil. This, however, does not mean that this is an impossible feat. Nor does it entail having zero social life during these arduous months, if you follow our handy directions. Topic Choosing a good topic is the first hurdle many students falter at. You need to consult with your supervisor about the relevant topics you can write about. Remember that your topic needs to be very specific, and cannot be a general idea, as you will be used to from your undergraduate work. Students know that Thesis Rush provides excellent dissertation writing help and is always ready to assist. One aspect of choosing a topic many students find especially difficult is the fact that they need to meet the requirement of originality. They mistake this for meaning that their writing should revolutionize their subject field and change the landscape. However, this is not the case. You need to remember that anything new produced in academia builds upon the current existing research. For example, improving or critiquing an existing method is constituted as original, and it very worthy of being a thesis topic. Learn More Get Ideas Research You need to conduct very good research to compile the best sources possible to implement in your paper. The best way to do this is to visit journals related to your subject field. These will have all the latest literature submitted pertaining to your topic, as well as an archive of past submissions. Through this, you can see how your subject field has evolved, and this can also give you a general idea of what type of topic you need to choose for your dissertation. Ask the librarian about the best books and literature available relevant to your topic. This can help greatly in collecting sources, as sometimes books can have sources that are hard to find online, especially for very specific and less popular topics. This means that your work should be formal and avoid any informal language, colloquialism, contractions and vagueness. Your writing should be concise and easy to understand. A mistake many students make is to think that they need to write with long and varied extremely varied vocabulary; this is not necessary. You just need to ensure your language is formal and easy to understand. Structure The structure of a dissertation differs in many ways from other essays you may have written during your undergraduate studies. You should structure your writing as follows: This is a paragraph summarizing your work. This should show on what page certain sections are Introduction: This section should discuss the topic you will be talking about and provide a brief outline of your work. This section should deal with the latest and past research pertaining to your topic. It should give some background knowledge to your reader and provide context. This section will deal with the methods you implement to gather your research, as well an analysis of it. Here, you discuss what you found through your research and analyze the results. This section should be a summarization of everything you have discussed, with emphasis on your findings. If you follow these handy directions, you will certainly achieve high marks for your thesis. Although it is a hard task to produce excellent thesis papers, it is certainly possible with our tips. Subscribe to our newsletter.
