Hepburn ave suite Most patients on a therapeutic testosterone replacement program will want to keep their testosterone levels regulated and consistent. Testosterone will also help men to regulate growth of lean muscle. Testosterone injections can help increase not only metabolism but burn fat as well as increase lean muscle mass, overall energy and recovery. TRT has been shown to help improve overall health.

2: Hormone Replacement Therapy

Hormone replacement therapy (HRT), sometimes referred to as menopausal hormone therapy, can relieve these symptoms. While there are some risks, systemic estrogen is still the most effective treatment for menopausal symptoms.

Sign up now Hormone therapy: Is it right for you? Hormone therapy was once routinely used to treat menopausal symptoms and protect long-term health. Then large clinical trials showed health risks. What does this mean for you? Hormone replacement therapy (HRT) medications containing female hormones to replace the ones the body no longer makes after menopause (HRT) is sometimes used to treat common menopausal symptoms, including hot flashes and vaginal discomfort. Hormone therapy has also been proved to prevent bone loss and reduce fracture in postmenopausal women. Along with the benefits, there are risks associated with using hormone therapy. These risks depend on a few factors, including the type of hormone therapy, the dose and how long the medication is taken. For best results, hormone therapy should be tailored to each person and re-evaluated every so often to be sure its benefits still outweigh the risks. What are the benefits of hormone therapy? The benefits of hormone therapy depend, in part, on whether you take systemic hormone therapy or low-dose vaginal preparations of estrogen. Systemic estrogen (HRT) which comes in pill, skin patch, gel, cream or spray form (HRT) remains the most effective treatment for the relief of troublesome menopausal hot flashes and night sweats. Estrogen can also ease vaginal symptoms of menopause, such as dryness, itching, burning and discomfort with intercourse. Combined estrogen and progesterone therapy may reduce the risk of colon cancer. Some data also suggest that estrogen can decrease the risk of heart disease when taken early in the postmenopausal years. Systemic estrogen helps protect against the bone-thinning disease called osteoporosis. However, doctors usually recommend medications called bisphosphonates to treat osteoporosis. Low-dose vaginal preparations of estrogen (HRT) which come in cream, tablet or ring form (HRT) can effectively treat vaginal symptoms and some urinary symptoms while minimizing absorption into the body. Low-dose vaginal preparations do not help with hot flashes, night sweats or protection against osteoporosis. This is because estrogen alone, when not balanced by progesterone, can stimulate growth of the lining of the uterus, increasing the risk of uterine cancer. What are the risks of hormone therapy? In the largest clinical trial to date, a combination estrogen-progestin pill Prempro increased the risk of certain serious conditions, including: Heart disease Blood clots Breast cancer Subsequent studies have suggested that these risks vary, depending on age. For example, women who begin hormone therapy more than 10 or 20 years from the onset of menopause or at age 60 or older are at greater risk of the above conditions. But if hormone therapy is started before the age of 60 or within 10 years of menopause, the benefits appear to outweigh the risks. The risks of hormone therapy may also vary depending on whether estrogen is given alone or with progestin, the dose and type of estrogen, and other health factors such as your risks of heart and blood vessel cardiovascular disease, cancer risks, and family medical history. All of these risks should be considered in deciding whether hormone therapy might be an option for you. Who should consider hormone therapy? Despite its health risks, systemic estrogen is still the most effective treatment for menopausal symptoms.

3: Hormone Replacement Therapy (HRT) & Menopause Treatment | Patient

One such therapy, bioidentical hormone replacement therapy (BHRT), has gotten a lot of attention in recent years. It promises a "natural" solution to hormone issues.

Restoring these levels can boost your energy, reignite your sex drive, and revive your enthusiasm for life! In fact, most men suffer symptoms of low male hormones like testosterone as they enter their late 30s, 40s, and 50s. Yes, that includes those of you from Salt Lake City, Utah, too! Even so, men of all ages continue to experience a rapid decline in health as testosterone issues go undiagnosed. Are you one of them? Here are 5 signs your testosterone levels are lower than they should be: You feel a reduced desire for sex. You have noticed a loss of muscle tone. You have a lack of energy and always feel tired. You have difficulty gaining or maintaining an erection. You suffer from decreased stamina, endurance, or drive. You suffer from a lack of drive and motivation that affects your productivity. Do YOU have low testosterone? Increase in productivity, efficiency and clarity. Improved sex drive, more stamina and energy. More energy and "my sex life is excellent now". My health has been so much better ever since. He definitely knows his stuff. We cannot guarantee specific results. Individual results may vary. This helps to reduce the risks and hazards commonly associated with hormone treatments. Before undergoing treatment, we evaluate your individual needs and interests before selecting the best method of treatment. This is either administered through bioidentical creams you rub on your skin or via injectable testosterone. Following your initial appointment at our office, we will teach you how to either inject yourself, or apply your own cream. Healthcare experts remain split on the topic. You see, once the aging process starts in earnest, your testosterone levels start to decline. With life expectancy on the rise, more and more men like you will be living longer, which means the signs and symptoms of low testosterone will be that much more severe. Normal testosterone levels for a year-old man, for example, range anywhere from 5 to 25. In this case, many other doctors would regard 25 as an optimal level for your age, and send you on your way. Traditionally a Free Testosterone lab value of 40 in a year-old would be interpreted as being too high. This is always our goal. Contact us to discuss your options. If you are considering testosterone replacement, contact our clinic to discuss the options. We can help you restore hormone levels with hormone therapy to an optimal point that reduces or eliminates symptoms and improves your quality of life without causing significant side effects. In addition to testosterone replacement, we also specialize in thyroid treatment and balancing the other hormones in the body to better achieve optimal health.

Corbis For many years, doctors routinely prescribed hormone replacement therapy HRT for the treatment of menopause and menopausal symptoms , as well as to reduce the risk of osteoporosis and heart disease. So what is HRT , is it an appropriate menopause treatment, and if so, when, and for whom? Read on to find out answers to common questions about this popular “ but controversial “ menopausal symptom treatment and whether it might be right for you. What is hormone replacement therapy? In addition to thickening the lining of the uterus to prepare it for egg implantation, estrogen “ in tandem with progesterone “ serves many functions. It helps the body to process calcium important for the strengthening of bone , aids in maintaining healthy cholesterol levels , and keeps the vagina healthy. With the onset of menopause, however, the amount of natural estrogen and progesterone the ovaries produce drops sharply. That, in turn, can lead to such symptoms as hot flashes, night sweats, vaginal dryness, painful intercourse, mood changes, and sleep problems. It also can boost the risk of osteoporosis. When is estrogen therapy alone appropriate? Estrogen alone is generally prescribed for women undergoing surgical menopause the result of a hysterectomy. The combination of estrogen and progesterone is for women who still have a uterus that is, those who have not had a hysterectomy. For women undergoing menopause naturally, taking estrogen alone can increase the risk of developing cancer of the endometrium the lining of the uterus. Adding progesterone in the form of progestin, a synthetic version of the hormone lessens the risk of endometrial cancer by causing the endometrium to shed each month. Who should consider HRT? Women with moderate to severe menopausal symptoms, as well as those with a family history of osteoporosis, are candidates for hormone replacement therapy. Who should not consider HRT? Women with breast cancer , heart disease, liver disease, or a history of blood clots, as well as women without menopausal symptoms, are not candidates for hormone replacement therapy. When should a woman begin HRT treatment, and how long will treatment last? Although the average age of menopause onset is 51 and, in many women, the most severe symptoms often last for two to three years, there are no hard and fast rules about when a woman reaches menopause or about the duration of her symptoms. Both ET and EPT are available as a pill, a gel, a patch, and as a vaginal cream or ring the latter two are most often recommended only for isolated vaginal symptoms. Some doctors say there is reason to believe that a low-dose transdermal patch is the best delivery method because it sends the hormones directly into the bloodstream, bypassing the liver and therefore reducing potential metabolic risk factors.
