

1: How to Become an Auto Dealer: 9 Steps (with Pictures) - wikiHow

Get the right combination of licenses and certifications. The department of motor vehicles likely got you started when you opened your doors, but running a popular dealership requires additional evidence of your commitment to the community.

These plans were sent to us anonymously, but we had them checked out by scientists and they seemed to be using a similar technology to one we knew was working. We reported about further developments in this area last December in an article titled Water Karma. Believing that the "believability gap" is a potent force preventing the realization of using water as fuel, we have continued to research other technological solutions. One of the reports includes footage of Drunvalo attending a live demonstration, in a format that you can watch on your computer. President Bush has made a challenge to the American people to begin running our cars on hydrogen as soon as possible, and has allocated over one billion dollars for research to find out how to do that. Neither method involves the need to spend a billion dollars. They are simple answers. The existing engines in our automobiles could work with these systems with very little alteration and no need for an external support infrastructure like the one now provided by gas stations, and which would be required by fuel-cell technology. To understand how these water-fuel systems work, it helps to begin by realizing that ordinary water is actually a "battery" containing vast amounts of energy. And, as President Bush says, hydrogen is an excellent fuel. The amount of energy in the water molecule is thus vast, and has absolutely nothing to do with the amount of energy it takes to break down that molecule. And yet if we can find an economical means to break down the water molecule, our energy problems are over. Instant Hydrogen Gas

The first process shown to us by Rothman Technologies uses water, salt, and an extremely inexpensive metal alloy. The primary owner of Rothman Technologies is a man who holds about fifty Patents Pending on a variety of mechanical devices, chemical compounds, novelties, and fuels. But it is his invention for using a metal alloy to break down the water molecule that is of interest to us here. This company was running a horsepower, gasoline-powered electrical generator using water as "fuel. They admitted that the system was crude and would have to be improved. Nonetheless, they could and actually did show us a gasoline engine running on water click on pictures for larger versions. This engine was mounted on a lab bench in a garage area, with the door open for ventilation. On the floor were thirteen half-gallon containers linked together with tubes, all connected to a central, larger tube that ran directly to the carburetor of the motor. In the containers was ordinary water plus an electrolyte. When a piece of metal alloy was dropped into the electrolyte mixture, hydrogen instantly began to form at an amazing rate. The hydrogen gas traveled to a main tube, and from there straight to the carburetor. A company representative pulled a rope to start the motor, and after a couple of tries, the motor caught and continued running. We watched the motor run for twenty minutes or so it was really cold, with the doors open in the Toronto January winter, so we decided that twenty minutes was enough "proof of concept". This engine, using water and salt as the primary fuel, and metal alloy as a catalyst, was definitely running! It is also noteworthy that, according to the man we spoke with, seawater could be used directly as the primary fuel, thus eliminating the need for added salt. So the video footage that you will be able to watch see link at the end of this article was shot by Michael for his company. Here is our opinion. The environment is experiencing tremendous problems at the moment, and one of the most serious of these is that we are losing our oxygen. The oxygen content of the air is becoming so low that it threatens our very existence in some areas. The normal oxygen content of our air is 21 percent. But in some places it is only a fraction of that! In Tokyo, Japan, for example, the oxygen content of the air has dipped to 6 or 7 percent. If it reaches 5 percent, people will begin to die. Tokyo has even put oxygen disbursement centers on its street corners, so that people can get emergency oxygen if they need it. Eventually, if something is not done, this low-oxygen situation will affect each and every one of us. It is for this reason that we feel it will be the future technology of choice for running our vehicles. This method uses oxygen from the atmosphere to complete the burning of the hydrogen in the fuel cell. What comes out of the tail pipe is oxygen and water vapor, but the oxygen originally came from the atmosphere, not from the fuel. And so the use of fuel cells neither takes away nor contributes to the

oxygen content of the air. This fuel is complete in itself. It does not need oxygen from the atmosphere to burn, which is an improvement over fossil fuels in saving the oxygen in our air supply. In fact, when hydrogen burns perfectly, nothing at all comes out of the tail pipe. If salt and metal alloy are used to create hydrogen, then there will be residues of that in the exhaust, but hydrogen fuel does not contribute oxygen to the atmosphere. This is the most perfect fuel of all for running our vehicles. Like pure hydrogen, it is made from water, i. For the scientists among our audience, you read that correctly:

2: How to Run a Car Dealership | Bizfluent

The run-in process for newer cars still exists, but is less critical to the long-term life of the car and easier - you simply don't need to worry as much as you did 10, 20 or 30 years ago.

How to Run a Car Wash by Robin Raven - Updated September 26, Running any business is a challenge, but running a car wash is in a class of its own. Unlike traditional, tangible merchandise, customers are buying a service from you. In order to complete successful transactions, you need to offer customers a good car wash for a reasonable price, a price that is lower than many competitors. You must still make a decent profit from the deal as well. While running a car wash is not something one can do on impulse and expect to be an instant success, it is quite possible to run a profitable car wash in nearly any town in America. Look at the employees who are running the show. A car wash is only as good as the elbow grease from the employees who are doing the washing. Write it all down. Keep records of everything. Time cards, employee warnings and financial statements should all be gathered in one central location. This should be secure from the curious eyes of any employee. Keep all towels freshly washed. This means that you need to have a cleaner service your business daily, or you could launder the towels yourself. Washing towels yourself is recommended only if your business is small enough to benefit from quick shortcuts. This is an especially good idea when you are beginning the company. Store all cleaners and chemicals in a secure spot. A child, pet or wild animal can easily get into containers that are left lying around. That can result in a toxic dosage or spill. Managing potentially hazardous materials is an important part of running a car wash. Materials should be locked up soundly after each business day, and these materials should be monitored by a trustworthy individual and perhaps a security camera during business hours. Place a sign in front of the car wash to state announcements from your business to the community. When a community leader is in trouble, post messages of moral support. Wish good luck to local sports teams. Advertise weekly specials on the board, as well. A sign is a great investment, as it can put you instantly in touch with the community. A sign can help your car wash develop a conversation with a potential consumer who never would have given the business a second look otherwise. A message board is a powerful business tool. Invest in a sign only if you plan to make use of it. Hang out in the front of your business. Greet customers regularly so that you know them by name. A customer is much more ready to send out a referral if she can tell her friends about the great owner or manager who takes such good care of her. Offer company incentives to employees. A discount for referred clients is standard. Bonuses at birthdays and major holidays are much appreciated and often are rewarded by a greater loyalty to the company and a harder working employee. Keeping yourself, the employees and the customers all happy in unison is a challenge, but you can succeed with hard work and patience. Tips Offer weekly specials to attract new and repeat business alike. While customers who are genuinely disappointed in the results of the car wash with understandable facts and reasoning should be catered to. While this stance may result in severe customer complaints on occasion, you will save money in the long run by not developing a reputation as a business that lets people walk all over it. About the Author Robin Raven was first published in Raven specializes in travel, health, beauty, culture, vegan nutrition, joyful living, arts and entertainment. She holds a Bachelor of Fine Arts in writing. Cite this Article A tool to create a citation to reference this article Cite this Article.

3: Running an Automobile on Hydrogen Using Water, by Drunvalo

Useful Tips on How to Effectively Run an Auto Repair Shop Written by: AppointmentPlus on May 14, February 6, Most people have become leery of using just any auto repair shop and prefer to stick with one they trust.

How to Install a Car Amp Installing car audio amplifiers is one of the trickiest things a newbie car audio installer can attempt. Car amp installation requires that all sorts of panels be removed and that various wires be run all over the car. Installing car audio amplifiers is a step by step process which I have outlined here. If you have any questions please contact me by clicking here. Please do not attempt a car amp installation if you are not comfortable with the process. Leave it to a professional. Now here are the steps on how to install a car amp. There is also a wiring diagram below. These directions assume you have already physically mounted your amplifier to a solid, non-conductive surface non-metal. If you have not purchased your power wiring be sure to read this article on choosing wire gauge for amplifiers. Determine what side of the vehicle the battery is on. Disconnect the negative battery terminal. Find a spot to run the power wire through the firewall. Try to find an empty rubber grommet that hides an unused factory hole. You can just put a hole in this grommet and run your wire through. If there is no factory hole you will need to make one. Get out the power drill and steel drill bits. I usually make a small pilot hole and then increase the bit size until the hole is big enough for my wire. If you have a stepped bit i. Uni-Bit that would be great to use see photo. I recommend them highly. Protect the drilled hole edges from rust with paint or a similar material. Caulk the gap between the inner diameter of the rubber grommet and the power wire if necessary to prevent water from running down the wire. StreetWires makes these type of two piece grommets which they call firewall bushings. Run the wire from the interior of the vehicle, through the hole and to the battery area, being very careful to avoid pinch points and moving parts in the engine bay. Install an in-line fuse holder see photo for the power wire as close as possible to the battery terminal connection the IASCA rule is within 18" but less is better. This fuse protects your vehicle from burning up in case of the power wiring shorting out. The wire between the fuse and the battery terminal will be unprotected, which is why you want this section to be as short as possible. The fuse size depends on the current the power wire will carry. You can also contact the manufacturer and ask them for that information. For multiple amplifiers you will need to add up the maximum current draw of each amplifier. Do not insert the fuse until all other connections are made! Connect the power wire to the battery using appropriate connectors for the wire and battery terminal. For more help on choosing a fuse size visit this page. Pull back the carpet in the area you intend to run the power wire. You will need to remove the rocker panel and kick panel covers to do this. Depending on your application, you can connect the power wire to the amplifier using appropriate connectors such as ring terminals, see photo or connect it to a power distribution block if you are using multiple amplifiers. After you have your power wire run the way you want it, go back and use plastic wire ties to secure the wire in place. You may also want to cover the wire in the engine compartment with wire loom prior to using wire ties. You can find this loom at auto parts stores and Parts Express. You will need to follow a process similar to that of the power wire steps 8 and 9. However, run your RCA cables on the opposite side of vehicle. You do not want to run power wires and signal cables on the same side of the vehicle. This could induce noise into your system. Connect the remote turn-on wire to your amplifier using an appropriate connector such as a ring terminal. The remote wire is what sends the signal telling your amplifier to turn on or off. It is a very important wire and your amplifier will not work without it. For multiple items using the remote wire you will want to use a relay. Now run your speaker wires between your amplifier and your speakers. If you need to run wires through the interior of the vehicle, make sure you run them on the same side as the RCA cables. You do not want to run power wires and speaker wires on the same side of the vehicle. This could induce noise into your system although it is less likely than picking up noise through the RCA cables. Connect the speaker wires to your amplifier using appropriate connectors such as ring terminals and to your speakers using the appropriate connectors such as female spade terminals, see photo. Most speakers have two terminals of varying sizes. The larger terminal is the positive terminal and the smaller is the negative terminal. If your speakers were previously connected to powered by your head unit you

will need to first disconnect the speakers from the head unit. You cannot have your head unit AND your amplifier connected to the speakers. This will cause damage to your electronics. Now you will need to connect the negative terminal of your amplifier to the chassis ground of your vehicle. Any metal point on the vehicle should work since they all lead back to the negative terminal of the battery. This negative power wire should be short and of the same diameter as the positive power wire leading to the battery. When connecting the negative power wire to ground, you may need to scrape some paint from the grounding surface. If you have a Dremel type tool with a metal brush these work great wear eye protection. This will ensure better contact between the negative power wire terminal and the vehicle ground. A wrong move here could puncture the tank, cause a spark and set your vehicle on fire with you in it! If you are unsure then consult a professional. After all connections are in place and all wires are secured, you may insert the main power wire fuse. If you are installing a car audio capacitor you will need to charge it first. This can also be done at the fuse holder. Reconnect the negative battery terminal. You just installed a car audio amplifier. See the instructions below. It covers many topics including in depth car audio amplifier installation. Basically you want to start with the first component in the chain the head unit and work your way to the last component the amplifier. You can be exposed to very loud volumes during this process so it is wise to wear hearing protection in most cases. You should still be able to hear the distortion through the attenuated hearing protection. Start by turning all of the input level adjustment knobs gain controls on your components fully counter-clockwise to their minimum setting. If you have more than one RCA pair you will want to set each gain adjustment separately. Make sure your fader and balance controls are set to the channel you want to adjust first. This can be an individual channel if you have individual gain adjustments or a pair of channels if you have one gain for two channels. Next set all of your equalizers settings if you have an equalizer to the center detent position so they produce no boost or cut. What we want is as pure a signal as possible. Put in some good quality source material, preferably a CD with strong output and a clean recording. Hard rock would be a bad choice here. When you hear it, stop and back off slightly until you no longer hear it. Now with your head unit at maximum undistorted volume move on to the next component. Continue this process until you have all of the components in the chain at their maximum undistorted level. When you reach the amplifiers you may need to wear hearing protection to adjust them to their maximum level. As before, turn up the gain until you hear audible distortion. This should be audible even with earplugs in. But honestly, if you have to wear earplugs to listen the distortion level is probably not a factor: Play some music and verify that everything sounds right. If you have any problems after the installation be sure to read over these three articles.

4: Water Powered Car

A car dealer may operate in several different modes in order to make money: running a used car lot, buying/selling wholesale cars on an as-needed basis or investing in a franchise branch of an already-established auto dealership.

This allows a music CD to launch your preferred media player and begin to play music. This also allows game or software CD to launch the game or program as soon as the disc is read. You can configure your Windows AutoPlay settings to automatically run depending on the type of media the computer detects on your CD. Locate the icon for your disc drive. This will usually be listed under "Devices with Removable Storage. Navigate to the "AutoPlay" tab. Here you will see the current Autorun settings for CDs with different media types. Choose a media type from the drop down menu. For example, you can choose "Music CD" if you want to change the way a music CD plays when you insert it in your disc drive. Place a mark next to the "Select an action to perform" option. Click on the action that you would like to happen when you insert your CD into the disc drive. Click "Apply" and then "OK" to exit from the settings once you have made changes to your configuration. The next time you place a CD into your disc drive that includes that media type, it will Autorun using your newly configured settings. Choose "AutoPlay" from the Control Panel. Place a check in the box next to "Use AutoPlay for all media devices" if the box is not already checked. Locate the media type from the list provided. For example, you can change the settings for an "Audio CD. Click on one of the options in the menu to make that the default action for a CD with that media type. For example, you can set the default to "Play audio CD" using a particular media player installed on your computer. Click the "Save" button at the bottom of the window once you have completed your configuration. Next time you place a CD with that media type into your computer, Windows will use your configured Autorun settings to launch it.

5: How to Open a Car Wash Business: 14 Steps (with Pictures)

Decide whether you will open your own auto repair business or whether you will purchase an established business. By purchasing an existing auto repair shop, you will immediately have an appropriate location and equipment, and the experienced employees may choose to stay.

The data is a set of device identifiers, which matches those identifiers reported to the system by the devices themselves. The default value for this entry consists of products identified by Microsoft testing as being unable to support AutoRun. This entry should not be altered from its default. Editing Group Policy[edit] AutoRun may be suppressed on particular drives and drive types by using the methods described in the Group Policy section. However, the Group Policy Editor is not available on Home versions of Windows XP [19] and does not provide any fine-grained drive selection facilities. Registry files[edit] A Registry setting file can be created that, when executed, makes the desired changes in the Registry. Windows Registry Editor Version 5. This is not optional. This example would need to be run as Administrator and a reboot would be needed for the setting to take complete effect. Initialization file mapping[edit] Windows Vista and later versions of Windows have a policy setting, "Default behavior for AutoRun", that can be set to disallow the reading of an autorun. This avoids certain scenarios where malware leverages autorun. Previous versions of Windows do not have this policy setting but the use of initialisation file mapping is an effective workaround. The following Registry file illustrates the workaround, where all autorun. DoesNotExist" As this key does not exist, it is as if the autorun. It is important to note that this applies to any autorun. Since either the policy setting or this workaround disable autorun, installation of software from an autorunning install CD or DVD will obviously no longer be automatic. When AutoRun is disabled, Windows should not proceed further through the activation sequence than the Registry check. However, it parses any autorun. This leaves the user open to attack from malware which uses the autorun. Double clicking the drive icon will infect the machine. Right Clicking and selecting the "Explore" or "Open" options from the context menu is not a workaround as these menu items can be coopted by the appropriate autorun. This bug was fixed in a number of security updates, detailed in Microsoft Knowledge Base article This is not a bug. Some programs may deliberately change AutoRun Registry settings. Early versions of CD burning software like Roxio have been known to change settings in this way.

6: How to Run a Car Stereo Directly Off a Car Battery | It Still Works

Top Ten Car Care Tips. Print. Advertisement. What you can do yourself to keep your car on the road If everything on TV were true, then keeping a vehicle running great, looking good, and lasting a.

How to Run a Car Dealership by Gail Cohen - Updated September 26, Ever wonder why car dealerships are frequently located right next to each other? Zoning laws and customer loyalty to favorite brands make it much more efficient for dealers to do business as neighbors. Run your business on practical principles of success by selecting the right mix of credentials, personnel, programs, ethics and incentives. Get the right combination of licenses and certifications. The department of motor vehicles likely got you started when you opened your doors, but running a popular dealership requires additional evidence of your commitment to the community. Encourage employees to get certified, earn specialized credentials and become the all-around vehicle experts folks want to find when they purchase a car. Exhibit the right attitude. Be willing to help customers get what they need and want at a fair price. Keep this philosophy at the forefront: The customer is always right. Keep popular items in your inventory. Determine the most often-ordered items by keeping a log of what parts you ordered and when. Cut a deal with a rental agency to supply cars to customers if their auto is on your lot for an extended length of time. Hire the right people. Salespeople may be born with a gift of gab, but not everyone responds to the equivalent of a guy in a plaid jacket with an overly enthusiastic glad hand. If consumers in your area are proving to be in the market for small cars, make sure you have plenty of small cars in stock. Customers know what they want even if you may not think their choices are wise ones. Accommodate the lifestyles of your customers. Some states prohibit car sales on Sunday, so dealerships close in compliance with the law. If your area has no such laws, you can still honor regional preferences by being respectful of consumers. For instance, Saturday is the Sabbath for Muslims, Jews and a number of evangelical faiths. Keeping your business closed on a day considered sacred can win over those consumers. She has authored and co-authored 14 books and penned hundreds of articles in consumer and trade publications, including the Illinois-based "Daily Herald" newspaper. Her newest book, "The Christmas Quilt," was published in December

7: How to run in a new car | Practical Motoring

That's how she came to franchising; it was a way to be entrepreneurial, but with a proven playbook. She started researching opportunities. Since arriving in Texas, White had become a loyal.

8: How to Run a Successful Auto Repair Business | Career Trend

To auto-run a batch file as administrator, you need to first create the batch file, and then create a shortcut for it. To create a shortcut, right-click the file, and select Send to\Desktop(Create shortcut).

9: How To Auto-run Batch Files As Administrator On Windows 10

Certain CDs have the ability to automatically run once they have been placed in your computer's disc drive. This includes Music CDs and some software CDs that may have the built-in ability to AutoPlay. This allows a music CD to launch your preferred media player and begin to play music. This also.
