Bill August 18, at 7: When importing a multi disk audiobook, under Info, the two boxes list track numbers, but they are greyed-out, so I am unable to delete the contents. Consequently, once imported, under Album view, the track numbers are displayed and then transfer to my iOS7 device making it difficult to navigate. Prior to importing, I change the song name to simply "Chapter 1, Chapter 2, etc. Oh yes, I have even gone in to the iTunes directory and deleted the track numbers so OS X file system just sees "Chapter 1, etc. MW August 22, at Can you help me sort this? Dede Owens September 14, at 8: I really appreciate the added step of how to join all the tracks into one when they have been imported into the audiobooks section of my iTunes library. I was facing twelve different tracks and wondering how that was going to flow seamlessly. BtrWrld October 26, at 7: Or is that something that is just a tease, something that is really not used and just a leftover from prior versions. I have corrupted my music database more than a few times trying to get audiobooks into their folder. PS, Using Windows 7 with the latest iTunes Michael Alderete October 26, at 9: Your library corruption problem is due to your sharing arrangements, nothing else. Judith November 16, at 3: Everything runs smoothly until the second to the last CD, which has a damaged area in the last three seconds of the final 6: At that point I get the pinwheel of death and have to force quit iTunes in order to eject the CD. If I stop the import four or five seconds before the end, none of that last track shows as having been imported. Michael Alderete November 17, at Because it never does. You can set the number of times that Max will retry reading damaged bits, which lets it try but then skip sections that are too damaged to be read.

Edit Article How to Import Audiobooks Into iTunes. In this Article: Importing Audiobooks from Your Computer Importing Audiobooks from a CD Community Q&A Did you know that you can import either digital audiobooks in MP3 format or audiobooks from CDs into your iTunes library?

Computers How to convert audiobooks for use in iTunes Many times people will have audiobooks in iTunes that are lumped with the rest of their music. Here is how to convert and import them so iTunes recognizes them as audiobooks. However, if you have audiobooks from other sources they may be in different formats, including standard MP3 or AAC formats, and iTunes may handle them differently when imported. Instead of keeping them with the rest of your books, iTunes may put them in the music section, along with all your other music. While you can create playlists and use naming schemes to organize your audiobooks, this can be inconvenient, especially if you have ones purchased from the iTunes Store that are being kept separately in the Books section. Recently MacFixIt reader Robin wrote in asking how to manage this problem: In iTunes I have a lot of of audiobook recordings that are stored by default in the music section and not in the audiobook section. Is there some way to get the books off of the music list and to the audiobook file? Luckily, there are some ways around this. The main difference between the two is that. Because of their format similarities, you can get your audiobooks to be recognized as such in iTunes by first converting them to AAC format, and then renaming the files and re-importing them to iTunes. Be sure to check the iTunes import settings before converting the file. Ensure "AAC Encoder" is selected, and then optionally set the encoding quality. The "Spoken Podcast" option should be enough for most audiobooks; however, you can use another preset or customize the settings manually if you wish. Close the preferences and select your audiobook in the iTunes window. Now delete both the new and old files from the iTunes library, and when prompted be sure to move them to the Trash do not click "Keep Files". With the files gone, go to the Trash and move the one that ends with ". Rename the file so it ends with ". The info window in iTunes is another way to change the media type for the file. Select the file in iTunes and press Command-I you can also do this with multiple songs selected , and then click the "Options" tab in the resulting information window. For the audiobooks, select the "Audiobook" option and the files should now show up in the Books section of iTunes as audiobooks. At this point the files should be placed in the audiobooks section in iTunes along with the rest of your audiobooks. If you use the manual conversion method and have more than one audiobook you would like to convert, first convert them all to AAC format you can queue them up and then delete them all at the same time so you can manage them all in the Finder in one step, instead of having to do all the steps each time for every file you want to convert. This is likely the best approach for managing audiobooks that have already been imported into your iTunes library; however, if you have books that are not already in your library then you might consider using a third-party tool for converting them before importing them into the program. Post them below or e-mail us!

Importing Audio Book CDs into iTunes Importing CDs for audio books can be painful, because there are usually a lot of them. And each CD usually has dozens of tracks on it, which makes it a nightmare to manage on an iPhone, to say nothing of the small screen of an older "classic" iPod.

What Difference Does It Make? Audiobooks are automatically bookmarked: You can play audiobooks faster or slower than normal speed. Audiobooks can have chapter stops within them. Audiobooks are automatically skipped during shuffle. But what if you have an audiobook on CD? The reason is that MP3 and MP4 use different compression schemes. Converting from one to another will not give as good results as importing directly from CD. If so, proceed with Step 3. Join Tracks within a Chapter Audiobook CDs are usually divided into tracks that are much shorter than the chapters. Insert the CD and wait for iTunes to display its contents. Verify that the display is sorted by track number the left-hand column. Identify the starting and ending track of each chapter. Highlight all the tracks of a given chapter by clicking on the first one and then shift-clicking on the last. Repeat for each additional chapter or partial chapter. If there are any partial chaptersâ€”a continued chapter at the start of the CD or an unfinished chapter at the end of the CDâ€”join all the tracks of the partial chapter in the same way. You can insert chapter markers before saving the complete book. This section lists the fields that matter for audiobooks. Name Tag for Chapter Titles please click to donate! Because this article helps you, please donate at OakRoadSystems. Give just the first track of every chapter a Name tag, since the other tracks will lose their names during import anyway. If you merge the chapters into one file, and you have an iPod Classic or later, both iTunes and iPod will display chapter titles. When you select the audiobook on your iPod, it will give you the chapter titles as a menu, in order within the file. So it makes sense to tag each chapter with its number and name. If you will keep each chapter as a separate file not my recommendation , then you need to give some thought to the Name tag. Presumably the designers expected every audiobook to be a single large file so that there was no need for an album-level menu like the one you get with music. Therefore you need to set Name tags that group the books with chapters in the correct order on iPod. When each chapter is a file, I recommend a two- or three-part Name tag: For example, here are some chapters from my audiobook conversion of The Lord of the Rings:

This article has helped thousands of people import audiobooks more efficiently, and it will help you, too. First, ensure that your import settings are optimal for audiobook and spoken word. See [Optimal iTunes Import Settings for Audiobooks](#) for instructions for how to configure iTunes for importing your audiobooks. Then move on to the next steps, where you actually import the CDs. These instructions are written for iTunes 10, but should work without significant modification in iTunes 9 and even iTunes 8. Worst of all, the track names are rarely recognized by the automatic Gracenote lookup service, so you need to enter them by hand. This import process attempts to reduce the amount of manual input, while also making sure that the track information is usable even on an iPod with a small screen. Insert the CD, and wait for the tracks to appear in iTunes. This will consolidate the many tracks on the CD into one, which will make it much easier to manage when the tracks are copied to your iPhone or iPod. The indication that the tracks are joined is subtle. In the CD Info dialog that appears, fill out the information you know about the audio book. Click OK, and the information will be submitted. You will probably be prompted to Select CD Category, since the online database uses a different category for audiobooks. The important partâ€”adding the author, title, and so on to the imported trackâ€”succeeded. The point is to attach the metadata to the track, not improve the Gracenote database. When the submission process is completed, all of the tracks on the CD should have the appropriate information attached to them. This means everything has worked so far. Click the Import CD button bottom right corner to import this disc, using the import settings you set up initially. When the import finishes, eject the CD. Repeat this process for the each CD in the audio book, until you have imported all of the CDs. Be sure you are setting the disc number correctly for each one! To give the best audiobook experience possible, though, you want to tweak the metadata a little further. Switch to your Library, and find the newly imported tracks. Verify that the Disc column shows that the tracks have consistent sequence information. Verify the information in the panel. You also want to delete any track number information: It should look something like this: Switch to the Options panel, and select Audiobook for the Media Kind. Setting the Media Kind to Audiobook tells iTunes to move the tracks to the Books source list, and also to treat the tracks differently. The selected tracks will appear in the Books source list, and be excluded from music-specific behaviors. Audiobook tracks also use separate sync settings for your iPhone or iPod, which you set in the Sync Audiobooks section of the Books tab for your device. Remember position tells iTunes and the iPod to make the file bookmarkable. Skip when shuffling keeps spoken word tracks out of your music mixes, where it would probably interrupt the mood. There is one last and frankly tedious step. For each track you need to update the track Name and the Disc Number fields. In this panel, update the Name field to be the title of the book, plus a sequence number. This way, the tracks will sort correctly when sorted by Name. In the Disc Number fields, verify that the right sequence information is set. Repeat the previous step for each track in the book. On the last track, click OK instead of Next. Did I mention this is tedious? Because you took the time to set the correct disc order information and set the track name field, it will be sorted in the correct playback order. Sync to your iPhone or iPod, and enjoy a great book! A final note for the benefit of RIAA lawyers, and those looking to avoid same: Keeping the book, or sharing it with others, would be illegal.

Import MP3 audiobooks into iTunes. Open iTunes. Go to File > Add to Library Navigate to the folder where borrowed audiobooks are downloaded. By default, you can find it here: Documents > My Media > MP3 Audiobooks. Highlight the audiobook folder you'd like to import, then click Open to import all of the MP3 files in that folder.

By placing content into this folder rather than just dragging content into the app, you can save both time and disk space when wanting to import media into iTunes. We can also create some useful Automator workflows that, when combined with this useful folder, will make moving content into iTunes a quick and simple process. Within this folder are a number of files related to the iTunes database and the main folder containing all of its media, named either iTunes Media or iTunes Music the naming is synonymous and simply depends on how long ago you started your iTunes library. Furthermore, importing a large amount of content can take some time since iTunes is busy duplicating these files. The Watch Folder We can skip the entire process of needless duplication by moving files into a watch folder named Automatically Add to iTunes instead. While iTunes is running, any new items found within this watch folder are moved into the correct subfolder and the iTunes database is updated accordingly. Within a few seconds, the file is moved into the appropriate folder in this case, it would be the Movies folder and instantly appears within the Movies section of iTunes. If I had imported this using the more traditional way of dragging the file to the dock icon, iTunes would have created a copy of this file and left me with the task of deleting the original once it had finished. Drag the folder to the sidebar to create a shortcut and you can drag any files you may want to add to iTunes quickly and easily. Instead, we can use Automator to create a service for the Finder that will provide a means of moving any items to the folder through the contextual menu. Launch Automator and select Service as the type of document to create. Change the option for Service receives selected from Text to Files or Folders. In the Actions column, search for the action Move Finder Items to the workflow. Save your service with an appropriate name, such as Move to iTunes. To avoid this, we can create a folder action that will notify us via Notification Center that some files were rejected by iTunes, and open the folder automatically. This will be the folder that our folder action will monitor. Launch Automator and select Folder Action. Change the option for Folder Action receives files and folders added to the newly created Not added folder. Search for the Display Notification action and add it to the workflow, then enter some appropriate text. Finally, add the Reveal Finder Items action to the workflow. Save the Folder Action and it will constantly monitor the folder for changes. You can test it by dragging a text file to the Automatically Add to iTunes folder and launch iTunes. After a few seconds, iTunes should move the incompatible file into the Not Added folder, where the Folder Action we just created will display a notification and then open the folder for you to take a look at. The folder name may end with.
