You can drag color tiles from: Any color slice in the middle of the color wheel Any area in the custom color scheme panel Any color in the palette Any color in the custom palette You can drop dragged color tiles on: Any area in the custom color scheme panel Any square in the custom palette The color mixer From the custom palette you can drag color tiles: To an area outside the custom palette to remove it To another square in the custom palette to move it To the color mixer or the custom color scheme panel Back to top As you select different colors, the colors in the custom color scheme panel change. Some of these colors are different variations of saturation and brightness, and some are chosen depending on the current color scheme. To customize the color scheme panel, drag and drop a color tile into any area. You then effectively "lock" that area, preventing it from changing when you select other colors. When areas are customized, or locked, a trash can icon to the right of the panel appears. Drag and drop colors in customized areas to the trash icon to "unlock" them. You can also click once on the trash icon to remove all customized areas and reset the panel. The plus sign to the right of the panel allows you to expand or shrink the panel. In expanded mode you can preview the panel, showing the RGB and hexadecimal color codes of each color area. In this mode, move the mouse out of the panel area to hide the codes so that all you see are the colors. In expanded mode you can also drag and drop colors to and from the custom palette. As colors are perceived differently depending on the size of color regions, the expanded view can be useful in determining the colors to use for projects that require large areas of color. You can change layouts by clicking on the change layout icon which looks like four small squares and is located to the right of the panel. Some layouts are dynamic and change according to the number of colors in the chosen color scheme. Other layouts are fixed and always contain the same number of color areas. Drag a color tile over the mixer without dropping to preview what the gradient would look like if you dropped the tile at that location. Hold the mouse over the color mixer and the color preview pane will reflect the color at that location. Click anywhere in the color mixer to select the color at the location where you clicked. Click on the "X" icon to the right of the color mixer to reset it back to its default a white to black gradient. Back to top There are a number of text fields in which you can enter values to specify colors: Click once in a text field to highlight the field, then enter the value you wish and either press enter return or the tab key. Press the backspace key if you make a mistake. Once a text field is selected, you can use the following keys: The up and right arrow keys increase the value by one. The down and left arrow keys decrease the value by one. The home key inserts the minimum value 0. The end key inserts the maximum value. Shift-arrow key increases or decreases the value by 5. The page up and page down keys increase or decrease the value by Shift-page increases or decreases hue angle value by Shift-page increases or decreases brightness and saturation values by Shift-page increases or decreases RGB and hexadecimal values by This allows one to easily move between web-safe colors. There are also a number of other keyboard shortcuts:
