

## 1: Irrepressible Hope: Devotions to Anchor Your Soul and Buoy Your Spirit by Traci Mullins

*Irrepressible Hope Devotional and millions of other books are available for Amazon Kindle. Learn more Enter your mobile number or email address below and we'll send you a link to download the free Kindle App.*

But all is not wrong, either. And on the 4th of July there is still much to celebrate. There are worthy dreams we know are being pursued. The food was good. The multi-faith fellowship was enjoyable. The mood of the evening, even in light of global issues of unparalleled urgency, was filled with hope. During his acceptance speech, Mayor Bloomberg said: We must be doing something right! The gala was held a week after the massacre in Orlando, an event that reminded us that so many things are not right. That act of violence against the LGBTQ population reminded us of the act of violence in Milwaukee against the Sikh community and the act of violence in Charleston against the Black community and the horror of an ever growing list of acts of violence that encompass a litany of places we cannot forget; Virginia Tech and Sandy Hook and Aurora. And, lest we forget, there are many other issues in our land that cause concern bordering on consternation: Not everything is right in the home of the brave and the land of the free. As Anne Murray sang years ago, "We sure could use a little good news today. Maybe Bloomberg was correct when he said that in spite of our myriad challenges, "we must be doing something right. After all, medical research continues to make great strides in the early diagnosis and treatment of devastating illnesses. Greater attention is being given to alternative energy sources that reduce the greenhouse effect and our dependence on oil, thus hopefully slowing the advance of global warming. Bipartisan populations are crying out for a more civil and honorable method of campaigning. People are giving feet to their prayers, effecting positive change, becoming advocates on important topics surrounding mental health and gun control. Because of the contemporary world of information technology, acts of racism and misogyny cannot any longer be kept out of view or swept under rugs. Multi-faith initiatives are springing up coast-to-coast with the intent of building bridges and forging pathways to peace. Unemployment figures are low. Is all right with our country? There are lofty ideals calling masses in courageous directions. There are compassion and charity, a longing for unity that both affirms and transcends diversity, new voices respecting the aged and new initiatives protecting the young, broadening understandings of the nature of love, deepened commitments to the love of nature and shared tears in the face of national tragedies. While diligently working to repair all that is not right, there are nonetheless countless reasons to celebrate all that is.

**2: Laughter, Tears, Worship and Irrepressible Hope**

*Irrepressible Hope has 8 ratings and 1 review: Published February 24th by Word Music, Paperback.*

Northern Pakistan has the greatest concentration of the highest mountain peaks in the world. Geological Survey researchers work with Pakistani researchers to collect water samples. In Pakistan, those are distinct possibilities. By , that yearly per capita availability could be cut in half, dropping to approximately cubic meters. As if the scarcity of water were not enough to contend with, the limited water that the country does have is often dangerously polluted. In urban areas, sewage seeps into drinking water supplies because of deteriorating infrastructure. Approximately , children die each year in Pakistan from waterborne diseases. Department of State and aid groups, including the U. Agency for International Development, are partnering with Pakistani government scientists through the U. The goal of these efforts is to help this developing nation devise sustainable water management practices to improve the health of its people and its economy. However, Tahir adds, mounting stresses on its water supply present a great challenge to a country with public health, economic and geopolitical concerns. A precarious setting On one side, Pakistan borders Afghanistan, the focal point of a global terrorism conflict that has sent hundreds of thousands of refugees into Pakistan, straining its resources even more. On the other, Pakistan borders India, a country with which it has been at odds over many issues – including water rights on the Indus River – since Pakistan won independence in The Indus drops down out of the western Himalayas, traveling through India before eventually making its way into the northeast corner of Pakistan. Some areas of the country rely predominantly on groundwater for both irrigation and drinking water, and it is being pumped at unsustainable rates. For example, water levels in the Quetta sub-basin aquifer in west-central Pakistan have dropped so dramatically that it is estimated that the aquifer will be dry in 20 years. The public water supply in urban areas is also running out. Lahore, like most cities in Pakistan, relies on groundwater which is often salinated and polluted to the point of being unpotable for its water supply. The city has seen the water table drop anywhere from 1. And as the water table drops, residents are finding that their wells are coming up dry or contaminated because their small electric pumps can only reach shallow depths. For example, in the parts of the country that see significant rainfall from seasonal monsoons, such as Rawalpindi, Peshawar and Quetta, due to a lack of infrastructure and improper drainage, water runs off and often leads to flooding in downstream areas – like it did in July and August, killing thousands of people – instead of being captured and stored at levels useful to larger populations. In the province of Sindh, conversely, some farmers located near the end of irrigation canals are left without sufficient water for their crops. This already-tight situation could be exacerbated by climate change. As glaciers in the warming western Himalayas retreat and release water, some areas of the Indus Basin have repeatedly flooded. According to estimates in a World Bank study, the glacial gushes will continue for 50 years or so, after which these natural reservoirs will be drained. The situation will then reverse, and within a century, the Indus Basin could see a 30 to 40 percent decrease in river flows from normal levels. That could be disastrous. The country also needs more large dams and reservoirs to store water supplies. But building such infrastructure is costly and controversial, and even if they could store more water, it might not be of sufficient quality. Poor quality Getting water is one concern in Pakistan. Another concern is dealing with the scary things in the water. Almost two-thirds of the water for public supply – that is, drinking, bathing and other household uses – is contaminated with everything from untreated sewage to industrial waste to pesticides and fertilizers. According to colleagues at the Pakistan Medical Research Council, diarrheal diseases cause high mortality in children. Pakistan has been addressing these problems. The country created a water quality program in and has built and improved office and laboratory facilities, developed low-cost water testing and treatment kits, installed 24 water filtration plants, and assessed more than 10, water supply systems around the country. But they still have a long way to go. But if the magnitude of the issues is any indication, mitigating them will be a significant challenge. In , the U. State Department and the Pakistani Ministry of Science and Technology signed an agreement to increase cooperation in science, technology, engineering and education, and in , USGS began working with Pakistan on water research. The State Department supports USGS through its

congressionally funded Biosecurity Engagement Program, whose mission entails increasing capacity for surveillance and laboratory diagnostics. PCRWR began operating in under a different name, but the mission has remained the same. The council promotes, facilitates, organizes and conducts water science research and creates related publications and data. That involved a lot of trips back and forth between Pakistan and the U. Pakistan now boasts its own National Water Quality Monitoring Laboratory, modeled after the USGS lab of the same name and, by the end of the year, the country will also have an integrated, nationwide water database. USGS has also shared with Pakistani scientists techniques for field collection, data entry, data analysis and interpretation, technical writing and outreach. Pollution is most problematic in and around large cities, where scientists have found hazardous industrial wastes, including toxic chemicals, heavy metals, pesticide products, municipal wastes and untreated sewage water, in natural water bodies. Waterborne diseases “ such as cholera, typhoid, dysentery, hepatitis, giardiasis, cryptosporidiosis and guinea worm infections ” account for about 80 percent of all diagnosed diseases in Pakistan and are responsible for more than 30 percent of deaths in the country. In Lahore, an estimated 97 percent of the industries using hazardous chemicals do not adequately treat their wastewater. What does the future hold? The challenges Pakistan faces in managing its water resources go beyond the technical or scientific. The conflicts that have arisen in the effort to combat terrorism make Pakistan a dangerous place to work on anything, including water, Taylor says. Pakistan has also long clashed with India over access rights to the Indus River system, and Pakistan has frequently accused India of violating their water treaty. Potential conflicts over water allocations exist between provinces and neighboring countries, and the lack of consensus on a national water policy interferes with the development of infrastructure, such as dam projects. In some places, like Karachi, local factions monopolize needed water by delivering it only to those able and willing to pay. Parts of northern Pakistan are overrun with Afghani refugees and members of the Taliban. As these large populations move into the country, the strain on water supplies will grow and be exacerbated by the potential effects of climate change. But there is reason for hope. History shows that the country has surmounted tremendous water odds before. The database, known as the Pakistan National Water Resources Database System, should also prove to be a worthy investment. In the past, different agencies have kept water resources data in a variety of formats, making it difficult to analyze data within single projects or gain insight from historic data, much less share data among agencies. The database system has been developed to make that analysis and sharing much easier. So where do things go from here? USGS and its Pakistani colleagues are working on a national water quality monitoring plan for the next several years, including a focus on arsenic and microbiological contaminants, and training on new sampling techniques. They were very self-sufficient.

### 3: Irrepressible Hope by Patsy Clairmont, Barbara Ferry Johnson and Nicole Johnson

*Irrepressible Hope has 12 ratings and 1 review. Amy said: On the voyage over life's turbulent sea, we're all forced ashore at times by fear, disappointm.*

### 4: Irrepressible Hope by Women of Faith

*What a powerful affirmation of this irresistible, irrepressible message of hope. Just think what might happen if everyone who received this newsletter passed along this pamphlet to someone who needs to know the Messiah.*

### 5: Testimonies of 'Irrepressible Hope' highlight Women of Faith

*An Irrepressible Hope is divided into three segments- Welcome, Struggle, Redemption - with drawings by world-famous Chicago Catholic artist Franklin McMahon. Questions for reflection are available from ACTA Publications.*

### 6: Irrepressible | Definition of Irrepressible by Merriam-Webster

## IRREPRESSIBLE HOPE pdf

*There is a great deal of yearning in the newly published "An Irrepressible Hope: Notes from Chicago Catholics." And some bitterness, too.*

### 7: Women of Faith: Irrepressible Hope by Women of Faith (CD, Feb, Integrity (USA)) | eBay

*An Irrepressible Hope is divided into three segments- Welcome, Struggle, Redemption - with drawings by world-famous Chicago Catholic artist Franklin McMahon. Questions for reflection and discussion of each article will be available by request.*
