

1: EU - ISI Formula Masters @ Monaco - Tuesday 5th January | RaceDepartment

The Master Journal List includes all journal titles covered in Web of Science. Search all databases for free.

Note that impact factors are reported in ; they cannot be calculated until all of the publications have been processed by the indexing agency. Journals that are indexed starting with a volume other than the first volume will not get an impact factor until they have been indexed for three years. Occasionally, Journal Citation Reports assigns an impact factor to new journals with less than two years of indexing, based on partial citation data. Annuals and other irregular publications sometimes publish no items in a particular year, affecting the count. The impact factor relates to a specific time period; it is possible to calculate it for any desired period. For example, the Journal Citation Reports JCR also includes a five-year impact factor, which is calculated by dividing the number of citations to the journal in a given year by the number of articles published in that journal in the previous five years. The Web of Science indexes more than 11, science and social science journals. This particular use of impact factors was summarised by Hoeffel: Experience has shown that in each specialty the best journals are those in which it is most difficult to have an article accepted, and these are the journals that have a high impact factor. Most of these journals existed long before the impact factor was devised. The use of impact factor as a measure of quality is widespread because it fits well with the opinion we have in each field of the best journals in our specialty. In conclusion, prestigious journals publish papers of high level. Therefore, their impact factor is high, and not the contrary. As impact factors is a journal-level metric, rather than an article or individual level metric, this use is controversial. Garfield agrees with Hoeffel, [10] but warns about the "misuse in evaluating individuals" because there is "a wide variation [of citations] from article to article within a single journal". Other criticism focuses on the effect of the impact factor on behavior of scholars, editors and other stakeholders. Because citation counts have highly skewed distributions, [25] the mean number of citations is potentially misleading if used to gauge the typical impact of articles in the journal rather than the overall impact of the journal itself. This article received more than 6, citations. Cawkell, sometime Director of Research at the Institute for Scientific Information remarked that the Science Citation Index SCI , on which the impact factor is based, "would work perfectly if every author meticulously cited only the earlier work related to his theme; if it covered every scientific journal published anywhere in the world; and if it were free from economic constraints. This effect is hard to evaluate, for the distinction between editorial comment and short original articles is not always obvious. For example, letters to the editor may refer to either class. Another less insidious tactic journals employ is to publish a large portion of its papers, or at least the papers expected to be highly cited, early in the calendar year. This gives those papers more time to gather citations. For example, in , the specialist journal *Folia Phoniatica et Logopaedica* , with an impact factor of 0. As a result of the increase, the journal was not included in the and Journal Citation Reports. A survey published in indicates that coercive citation has been experienced by one in five researchers working in economics, sociology, psychology, and multiple business disciplines, and it is more common in business and in journals with a lower impact factor. Released in May , DORA has garnered support from thousands of individuals and hundreds of institutions, [21] including in March the League of European Research Universities a consortium of 21 of the most renowned research universities in Europe , [49] who have endorsed the document on the DORA website. Closely related indices[edit] Some related values, also calculated and published by the same organization, include: As with the impact factor, there are some nuances to this: Scientometrics Additional journal-level metrics are available from other organizations. In addition, article-level metrics measure impact at an article level instead of journal level. Other more general alternative metrics, or " altmetrics ", may include article views, downloads, or mentions in social media. Counterfeit[edit] Fake impact factors are produced by companies not affiliated with Journal Citation Reports.
