To adapt EJB 3. To obtain a serializable timer handle that may be persisted D. To be implemented by EJB classes that are to be registered with the timer service Answer: The TimerHandle interface allows the bean provider to obtain a serializable timer handle that may be persisted. The majority of the methods will be used by role "user". All methods must have role permissions active and roles may be added or changed in the future. Which two scenarios are correct? The developer annotates the bean class with PermitAll and annotates the methods used by role "guest" or "admin" individually. The developer annotates the bean class with DenyAll and annotates the methods used by role "user", "guest", or "admin" individually. The developer defines individual method permissions for the methods used by roles "user "guest", and "admin" In the deployment descriptor. The developer annotates the bean class with RolesAllowed "user" and annotates the methods used by role "guest" or "admin" individually. What is the expected result of this method invocation assuming control reaches Line 12? The container discards the BarBean bean instance. D The transaction will roll back. Although beans with container-managed transactions require less coding, they have one limitation: When a method is executing, it can be associated with either a single transaction or no transaction at all. If this limitation will make coding your bean difficult, you should consider using bean-managed transactions. Clustering is guaranteed to be supported by the EJB 3. Thread pooling can be optimized by the Bean Provider programmatically. Bean Providers are NOT required to write code for transaction demarcation. Support for server fail-over is guaranteed for an EJB 3. The EJB tier hosts the business logic of a J2EE application and provides system-level services to the business components problems include state maintenance, transaction management, and availability to local and remote clients.
