While not a major revision of the operating system, Rollup 2 includes some significant changes. Other improvements long sought after by users, such as CableCard support, will likely not appear before the release of Windows Vista. With support for new set-top Media Center Extender network devices, you can now use MCE to access files on your PC from displays in the other rooms in your home--the TV in your bedroom, for example; each MCE PC can support up to five Extenders, over wired or wireless networks. Plus MCE also now supports dual TV tuners, which means you can watch one channel while recording another. The printed instructions contained clear illustrations for connecting our test PC to a variety of display types, along with details explaining how to connect the PC to wired or wireless networks and add set-top Media Center Extender devices into the mix. PC vendors and networking companies such as Linksys will sell Extenders as standalone products. We connected our test system to a digital LCD and a digital satellite cable box, then connected it to an After we powered on the PC and started up the MCE interface, the setup wizard walked us through the setup process, the majority of which we could easily navigate with the included remote control. Within 10 minutes, we received a live TV picture and had downloaded the program guide for our area. The only hitch along the way was getting MCE to recognize the IR blaster we had connected to the PC and placed in front of our satellite cable box. It recognized our satellite cable TV connection, and we had a picture within 10 minutes. Setup was a snap. Since our test system had only one TV tuner, if we changed the channel on the Extender, the channel changed on the PC, too. Unfortunately, we could neither fast-forward nor rewind when playing a recorded video. And on a large inch screen over a wireless On the whole, MCE is more visually appealing and responsive than past versions. Microsoft has made it easier to get to your most commonly used functions--next to each item on the main menu are three icons that are shortcuts to oft-used tasks. MCE is quicker, too. The new Movie Finder--a subset of the program guide--takes full advantage of the cover art; it pulls out all the movies from the program guide, letting you know which movies are currently on and which start within the next hour. Its basic function is to give you a remote-control-friendly interface for watching and recording TV along with accessing the videos, photos, and music on your PC. There are rumors, however, that add-in cards such as TV tuners might come bundled in a kit with the OS from graphics card and TV tuner card vendors. With two tuners, you can record two different shows concurrently or watch one show while recording another. You can record your favorite programs with one-button ease. Outside the box, two developments take center stage. This development allows you, for example, to connect the MCE system in your home office and stream content from the system to the TVs in your living room and bedroom. Other files--videos, recorded TV, photos, and music--can be accessed independently, however. Microsoft is right in saying that it would be a poor user experience to have to run to one room to load a DVD in order to view it in another. Our question is, then, why not build a DVD drive in the Extender itself?

Status Discontinued Windows Media Center is a digital video recorder and media player developed by Microsoft. It is an application that allows users to view and record live television, as well as organize and play music and videos. It is also available as a paid add-on for Windows 7 and Windows 8. Media Center can play slideshows, videos and music from local hard drives, optical drives and network locations. Users can stream television programs and films through selected services such as Netflix. Content can be played back on computer monitors or on television sets through the use of devices called Windows Media Center Extenders. It is possible to watch and pause live TV with support for up to four TV tuners or two dual-tuner cards a maximum of two tuners outside of the United States. These standards are unencrypted broadcast television. It is possible to view encrypted private network television stations that are not broadcast over the air with internal and external tuner options that support the insertion of a CableCard provided by the Cable TV company. Windows Media Center has since been discontinued as of Windows 10. The user interface was redesigned and tailored for the Windows 7. Support for multiple tuners was added in later releases and varies depending upon the version of the operating system purchased. Also introduced to Windows 7. It is not available as an update for existing Windows Vista Media Center users. Users can record television programs manually or schedule recording via the electronic program guide. Recordings can be burned to Video DVD or, barring copy restrictions, be transferred to a portable media player. All the tuners use the same guide data but it can be edited and configured to include additional channels such as Clear QAM not found or included in most Titan Guides. While watching live television, the program keeps a buffer that allows users to rewind or pause live TV, allowing users to skip commercials. A third party program MCEbuddy allows automatic commercial skipping on recorded programs. Media Center can stream live and pre-recorded television to Windows Media Center Extenders such as the Xbox console, but other Windows computers can just access recorded, not live content. Playback of content on television is possible through Media Center Extenders or by directly connecting a computer running Windows Media Center to a television. The menus of Windows Media Center are displayed in a foot user interface suitable for viewing on large screen televisions and can be navigated using various remote controls. Windows Media Center PCs require a sensor to be able to interact with the remote control. The sensor must have Windows Plug and Play device drivers. To advertise Media Center support, remote controls must also have certain buttons such as the Green Media Center logo Start button and buttons for navigation, playback and volume controls, power and channel flipping. Music albums are arranged with accompanying album art that can be downloaded off the Internet automatically or added manually into Media Center. Users can create playlists of different songs or albums as well. While playing music, the user can pause and fast forward songs and view visualizations. Media Center allows users to browse pictures and play them in slideshows, as well as play video files. Media can be categorized by name, date, tags, and other file attributes. In addition, users can organize and play films through the "Movie Library" feature introduced in Windows Vista Media Center. Through the "Internet TV" feature, users can also stream television and web shows from select content providers. While synchronizing television shows, Windows Media Center encodes the shows using Windows Media Encoder to a Windows Media Video format at a lower quality than the original format used for viewing on the desktop media center. This is to complement the limited storage space and processing power of such portable devices. Optionally, music can also be re-encoded to a smaller file size upon synchronization. The functionality of Windows Media Center can be extended by three different types of applications: Presentation Layer applications can have full access to both the .NET Framework as well as the Windows Media Center API, with the latter exposing a managed object model to access and manipulate the current states of the media management and playback, live television, video recording as well as the presentation capabilities of Windows Media Center. MCML is used to define the user interface, with animation, text input, navigation, data binding, and local storage support available from the markup itself. If

custom code or other functionality is required to implement a certain feature,. NET assemblies can be referred. NET language can be used to write the code-behind assemblies that implement the required functionality. Content which defines what that UI element will display, Properties to control the presentation aspects of the element, Locals which enumerate the set of private state data for the element, and Rules which allow the attributes to be modified based on certain triggers. By modifying these attributes at runtime, either from markup or code behind classes, the interface is generated. However, in the latter case, the code is untrusted; only the .NET classes that are marked as safe for use by Internet-originating code can be used. Before an application can be used, it has to be registered with Windows Media Center. An application can either register itself as a top-level menu item, in any of the sub-menus depending on the type of application , as an autoplay handler, into the Program Library the menu category for all programs , or as a background application without a user interface running as long as a WMC session continues. HTML applications are also not fully supported for streaming to extenders.

Today October 12th is the day that Windows Media Center is launched. The movies portal lets you browse movies visually using the cover image of a movie plus you can view more information on the movie such as cast and crew, reviews and synopsis. Media Center will now play playlists of videos. Previously when watching a video over the internet Media Center had to download the whole file before playing it, now it will start playing it as soon as it can which makes watching internet based video much better. For Music this will display the last three items played i. The minimize, maximize and close buttons have been replaced with a single power button which when clicked presents a number of options such as close, standby, shutdown, restart and log off. Press the "more info" button on your remote to display the context menu - this will provide more options for whatever is currently selected. Extenders Extender devices are set top boxes that connect to a TV and let you use Media Center remotely. Multiple people can now use a single Media Center PC at the same time in different locations around your home. You might have the Media Center PC in your home office, an Extender in the living room and perhaps the kids have an Extender for their Xbox as well Add-ins are small managed code applications that run inside Media Center. Add-ins can run in the background all the time to provide notifications. Add-ins can run on-demand to perform a specific task such as uploading a photo to a website. There are new APIs in this release for using the Parental Controls, displaying the new style dialogs and a few other things. Now you can place your application in places throughout Media Center: The More With This MWT class of entrypoints are available in each of the different experiences in a number of categories. When using a MWT entrypoint the application has access to the "context" at the time of the application starting. For example, the user can start an application by bringing up the context menu on a photo, selecting "More Your application will have access to the specific photo and can perform an action on it - i. Does your application have something new? Perhaps the movie the user wanted has finished downloading. In addition if you have something new for the user you can use the NFM entrypoint to take the user to a different place in your application - for example in More Programs clicking your icon might normally take the user to the front page of your application - but when you have new content you navigate the user directly to your "new items" page. Each experience can now have a button that will display a page similar to More Programs, so if your application is specific to photos you can register your application to appear in the "More Photos" page. You can get the new SDK soon from here.
