Mini Max Plans - 8â€² This is the design that really started it all. Designed by William Jackson this easy and simple to build Mini Max has put more people on the water than any other design.

Tagged 0 Thread s To make a mold you would wax the living crap out of your hull for a mold release. Spray it with gel and glass it up. Then you add some massive stringers and bulkheads to keep the mold in this shape. The bottom of the molds would probably have caster wheels. Both molds would sit above the ground high enough to be comfy for you to lay up the glass in them easily. A mold is a super strong hull but its the negative. Everything else is about the same. You would mold just the hull and then just the deck. This design either needs to be modified to allow the deck cap to fit over the hull or it would need a rabbit kind of joint so you could glass them together to get the wood look along the rub rail area. Almost all glassed boats have this joint visible due to this molding method. The hull and deck both need draft, an angle with no undercuts so your boat, can come out of the mold. This applies also to getting your hulls out too. Usually boats already are drafted due to their structure. Since your primary reason is speed and ease though there is another way to do this out of wood with no molds. Make templates for each wooden part. Now you can attach the template to the wood panel and route this part out. Since they are all the same only assembly is needed. No layouts or measuring. Have an assembly jig similar to the framing system. Whatever you need to easily assemble the boat. This method has several advantages. You can finish the boat so it remains a wood finish, something I always think is nice. A mold costs several times the cost of a hull its making. A mold takes up a lot of room. The templates and jigs can be made out of cheaper wood or materials. The templates can stacked and the jigs can be knocked down if needed. If there are parts like frames made up from a bunch of wood pieces. You can still template and jig the frames or change the things so its cut out of plywood. Some parts could be a composite. The dash area could be glass but is covered with a veneer, or not. You can mix and match systems to get the best of both.

The plans are fully lofted at and are spread across only 2 sheets 3'x8'â€². The top deck is fully lofted and drawn 'flat' so when formed it will form perfectly to shape. I have added a transom brace only and removed the holes from the stringers to provide watertight compartments, this provides some kgs of buoyancy.

Free Minimax Boat Plans Basically, anyone who is interested in building with wood can learn it successfully with the help of free woodworking plans which are found on the net. The specific way each feature is presented and the material covered in these sites are the best reason for downloading Free Minimax Boat Plans woodworking plans for your construction projects. You get blue prints, images and materials when you download these plans from the net. It does not matter whether you are skilled or not, these detailed instructions will assist you all through your project till you have completed it successfully. You will also get tips on how to start a woodwork business from some of the free woodwork plans online. These Free Minimax Boat Plans woodworking plans also have few limitations to speak of, though these are minor ones compared to the advantages you gain from them. One of the common complaints about free plan software is the time which is taken for it to get downloaded completely. These plans are quite vast and if the internet is slow, it might take you hours to download the whole Free Minimax Boat Plans plan. The other disadvantage of free plan is that the measurement provided is of a specific kind even though both kinds of measurement systems are available. You lose time by making the effort to convert the measurements into your kind of measurement system. On the whole, any of the free plan software are great and every woodworker can greatly benefit from the plan packages for building woodworking projects in a confident and successful way. The free woodworking plans are worthy of a trial. This is true, especially, when you need assistance in your woodworking skill, while working on a specific project. You can select from the vast amount of plans available in the free Free Minimax Boat Plans woodworking plans online, which are offered by expert and experienced woodworkers. If you do not have the proper information, instruction, and skill, you may land up spending more money and time than you originally intended to spend. As a beginner woodworker, you need have the space, time and the correct tools. Having said, there are a few essential factors that you should keep in mind, before starting with any woodworking project. If you are beginner, you should first need to be very interested in woodworking. Creating something new with your own hands is a special feeling. Do not start a project if you are not interested, as this may land you in a bad place. Think of the main reason of creating this woodworking project. Decide on the uses of the item you are making. Consider your skills and analyze the time you have, before you start with a project. Start projects that you can finish. If you are in the middle of some work, then it is better not to start any project at all. If you keep these essential points in mind before you begin a Free Minimax Boat Plans woodworking project, it will become very easy for you to achieve success. Woodwork requires planning as much as it requires effort. So how do you get started? As a beginner, always select a project that has a very basic build up or a simple construction. Some easy to begin projects include, bird feeder, benches, shelves, etc. As soon as you get hold of the techniques, you can always move to the next level of woodworking projects,

like cabinets, sheds and others. Beginning projects should always be less complicated and less frustrating so that you have a better knowledge of working with woods and their tools. Once the project is selected, start selecting your tools. Many people think that power tools are needs. However, for beginners basic hand tools can be very handy and more than helpful in completing a project. If woodworking is your hobby, then a few tools that you would require are: Workbench - A workbench is required for precise cuts and measurements. The workbench when fixed with vises offer ample space to work. Hammer - Hammer is an essential tool for woodworks. It helps you to drive nails, pins, staples, etc. A small and lightweight hammer will make things much easy for you. When you buy a hammer, always check the balance between the weight and stand. Always select a sturdy, yet lightweight product. Saw - A saw is another tool that you cannot live without while woodworking. This tool helps you to cut woods at different sizes. There are different types of saws available in the market. Choose a size that you can handle. Screwdriver - Screwdrivers are available in different shapes and sizes. Mostly there are Canadian types and standard flat type. Having all of them will help you in advance woodworking. You can also buy power screwdrivers as they make the work much faster. Measuring tape - It is another very important tool that you cannot work without. The measuring tape helps you to measure wood before they can be attached together. Wrench - Some woodworking projects require fixing bolts and fixes. For such projects, you require wrench. However, this is not a tool for beginners, but having it would make work easier for you at a later stage. Drill - Drill helps you make holes in wood. Power drills are more useful but they cost more. Low wattage power drills will make the task much easy. Other small and basic tools - These include pencils, gum, staple gum, level, erase, first aid kit and shop vac. Based on the type of project you want to complete, pricing can be determined. The simple the project, the less cost it involves. However, at the very beginning buying the tools will be a little hefty. Therefore, it is better to fix a budget first on the tools, then on the project. Buying the basic tools will ensure that you do not need to buy any more material other than the wood ply. Free Minimax Boat Plans Time and Instructions Instructions are one of the primary things that every beginner should follow. It is like the woodworking Bible. Instructions guide is a very easy to understand process, what to do and how to do it. It is a systematic guide for completing the project. Time also plays an important role in the building of woodworking projects. Woodworking projects require time and therefore it is necessary for a beginner to have ample amount of time every week. Nevertheless, the most essential thing that will help you to achieve success is proper planning. With proper planning and a strategy, it is possible to achieve success quickly. If you know the purpose of woodworking, the item you want to build, the tools you require to own and the average time you can give every day; then you are all set to go. Free Minimax Boat Plans Conclusion All these tips and instruction will make the woodworking projects and plans for beginners fast to complete. Always make sure that you have all the essential tools, materials, space ready. Keep the instructions of building an item handy. Proper strategy and planning will help you to make a great woodworking project for your home. Plans for Wood Furniture, is a renowned woodworking expert. Being old fashioned, the cool way. Friday, July 20, Mini Max hydroplane Update on the virus warning in the comments: I just received a mail from the administrator of the Muskoka seaflea page, and they were attacked heavily about a week ago. They have had it all cleared, so it should be safe now. Apparently a warning can "hang" in the system until you update your browser? When I tried to tell him that we could probably get a rowing boat or a small sailing dingy, he looked at me the way only a frustrated teenager can do. The look that clearly tells you that in his opinion you must be living in the 20th century which happens to be correct for my part. Sitting out here without a definite woodworking project going on, I started surfing the web for some inspiration. Those on the cover of Popular Mechanics etc. Nice looking cover articles from a time when the western world was pastel coloured - and smoking and drinking was recommended by your local doctor as a perfectly legal way to wind down after a long day at work. There are a couple of places that has those old designs available as free pdf files for downloading. I ended up at a place called Muskoka seaflea , they had just the right plan for me. The incredible Mini Max Hydroplane. According to the article, you can build it in two days, or one day if you have some woodworking experience. The most expensive stuff being the epoxy and the paint. We have an old 4 hp outboard engine, and that will have to make do for a start. If it is a success, I might have to look into finding a more powerful motor later on. I have spent a bit of time figuring out the radius of the curves shown on page 2 of the instructions. According to my calculations, the radius of the "fore center strut" is The plan is off course to get the boys involved. The individual pieces are not very heavy, and today with the possibility of using screws instead of nails, the buys can really play their part. If all goes as planned, I will be back home Tuesday night, so Wednesday would be a logical starting point with a trip to the lumberyard for some plywood and possibly some screws. In the free world, it is probably legitimate to let your children play in a speed boat. But guess which country that has regulations for that as well.. So by making a really short hydroplane I elegantly manage to circumvent the regulations, and can let my kids use the boat to their hearts desire. As long as I stay below 19 hp.

You might want to make one from my plans. Steering Your steering system starts with a shaft and a pair of bearings. An aluminum shaft would be good lightweight choice; a stainless steel shaft will be corrosion resistant. I get flange-type bearings from Surplus Center. Each of these bearing has two set screws so they can be locked to the steering shaft. So climb into the boat and hold the wheel in front of you at a comfortable height. I make my own steering drums from plywood circles. The larger circles are about six inches in diameter; the smaller ones about five inches. A large diameter drum like this makes for quick steering. My wheel rotates only a little more than a quarter turn in either direction. These allow the drum to be locked to the steering shaft. This way, as the engine is trimmed up and down, cable tension stays constant. Trim My trim system includes a Mercury cylinder attached to the motor and the transom with homebuilt brackets. The bracket on the transom is made from aluminum angle or channel. A better arrangement is to have the forward end of the cylinder attached to a bracket that is part of the jack plate. This way, as you adjust the jack plate up or down, the entire cylinder moves with it, without changing the geometry of your trim system. My jack plate plans now include this optional bracket. The orange piece wraps around the bottom of the swivel bracket. The bolt at left holds this piece to the motor, while the trim cylinder is attached to bolt on the right. Short pieces of steel extend upward from each of these bolts and are attached to a third bolt, whose head can be seen at the top of the picture. More information about building this bracket can be found [HERE](#). There are lighter batteries around, of course, but I need the weight anyway -- minimum weight for GT Pro is lbs. The battery hold-down is bolted through the coaming. The battery is used for the electric start and the trim pump. Races start with the boats lined up along the beach, engines off. When the flag drops, you hit the starter and away you go. Actually, you have the option of lining up with your engine idling, in neutral, so electric start is not essential. The fuel tank is three gallons, more than enough for a twenty-lap race. Two ratchet straps hold it down. The Mercury trim pump, almost lost among the wires and hoses at upper right, is bolted to the transom. Cockpit A foot-operated throttle is required for racing, and highly recommended for the non-racer. Look for the "Hot Foot" or the "Hot Shot" or similar units. This one is a "Lead Foot. On the right side of the dash is a Tiny Tach tachometer. On the wheel is the trim switch and a lap counter. I have yet to remember to use the lap counter. Too busy driving the boat. At lower left is the shifter. Propellers Best performance will be realized if your engine is jacked up quite high, with the prop shaft perhaps only a couple of inches below the bottom of the boat. Cupping is little more that a short curl along the trailing edges and sometimes the leading edges of the blades. Cupping can be seen on the blade at right. New props can often be ordered cupped. Or a propeller shop should be able to cup one for you. Consider having your prop guy thin down the blades a bit as well, if he does that sort of work. Another excellent choice for your v-bottom is a chopper like the one in the photo. This propeller gives good bow lift and speed. I won at the OPC Nationals with this prop. This chopper is slightly less than 10 inches diameter a little more might be better -- Pitch is 18 inches. See Ron Hill on ebay:
