

### 1: Rent Miracle in the Void () on DVD and Blu-ray - DVD Netflix

*"Miracle in the Void" was more of a psychological book than a parapsychological book. That's okay. I liked the book because I identified with the people mentioned who work in so-called "fringe science research."*

The New Energy Revolution Dr. Global warming has been reversed. The air is clean. Power and gas stations have been put to other uses, and the unsightly grid system has been dismantled and recycled. An unusual type of energy makes all this possible. It does not come from the sun, wind, rain or tides, nor is it a fossil or nuclear fuel taken from the ground or chemically synthesized. In some cases the source appears to be everywhere in space-time, invisible and infinite. In others, nuclear transmutations seem to be miraculously taking place at room temperature accompanying the release of energy. Incredible as this scenario appears, we shall see in this article that laboratories around the world are repeatedly tapping into this abundant energy. Some leading theoretical physicists are beginning to understand why and how this is possible. Several companies are in the beginning stages of bringing workable devices to market that clearly produce more energy than what is needed to run them so-called overunity devices.. Research Breakthroughs and Commercial Developments According to knowledgeable observers, we should focus our attention on six new technologies: Created by inventors Dr. Paulo and Alexandra Correa at Labofex in Canada, the system is well on its way to commercialization for electric power generation in vehicles and in homes, solidly protected by U. S and foreign patents U. The Correas write conservatively: The cost of kWh kilowatt hours produced by this technology is estimated to be more than ten times cheaper than what is presently available from any other energy source. His high-density charge cluster device produces more than thirty times greater output than input energy. At first glance, they seem to violate a principle of physics that asserts that electrical charges, either positive or negative, repel each other. Because charge cluster technology works without the need for magnetic fields or low temperatures, it could well be one of the first new energy devices to be commercialized. By bombarding radioactive nuclei with charge clusters, the induced nuclear reactions primarily fissioning of the heavier elements result in a reduction of harmful radiation. Laboratory experiments show a dramatic transmutation of radioactive thorium into smaller-mass elements with the marked reduction of the naturally radioactive thorium. With proper engineering complete eradication may become possible. Lambertson has conducted materials research and development for such organizations as U. He has been doing independent research over the past two decades on a solid state device which he believes can provide a practical source of power through the harnessing of zero-point energy. An accelerated electrical charge sends a stream of electrons into the E-dam, and the electrons become stored much like a conventional dam stores water. When the electrons are released, they gain energy from the zero-point energy present in the E-dam. After they flow into the unit to be powered, they move into another E-dam for recycling. Lambertson changed his cermet chemistry and E-dam design when he learned that an unexpected chemical reaction was taking place. A different combination of materials and composite design appears to stabilize the process, and a yield of percent was achieved in tests conducted in . Since that time an induction effect has become a major problem which severely inhibits charge acceleration and yield. The present direction of his research is towards reducing induction in his E-dam using two different complementary approaches. It appears that these approaches will solve his remaining major problem. His highest yield using these approaches in June was percent. Lambertson is confident that he will achieve higher yields with further experimentation, probably as high as per cent, the level needed for commercial viability. He is currently exploring future production with interested manufacturers. Lambertson has a strong interest in providing new solutions for the energy needs of developing nations. Highly regarded Canadian inventor John Hutchinson has developed a solid state "crystal energy converter" made out of very common materials which is an electrical power source he claims behaves like a battery and never runs down. This small, self-running power source, which typically puts out DC power amounting to one or two volts, has produced up to six watts of power, and he believes it could be engineered to replace batteries and other power needs. In his lab, Mills puts in a small amount of hydrogen gas into a vacuum-sealed, three-quart stainless steel "can", adds a few tablespoons of a common chemical compound, turns up the heat to about degrees centigrade and seemingly

creates ten to twenty times more energy than he put into the process. As the hydrogen nucleus collapses, the electron gives off heat energy, and the smaller the nucleus gets, the more heat the electron gives off. Once started, the reaction can sustain itself, as the hydrogen atoms collapse smaller and smaller, releasing increasing amounts of energy with each collapsing "transition". The important point is that the experimental results show that it works. An impressive feature of the BlackLight Power gas cell is its simplicity. If successful, the process is also attractive because it is safe, lacks harmful byproducts or emissions, and does not require the use of exotic or scarce materials. The only "waste" products are collapsed hydrogen atoms, or what Mills calls "hydrinos", which have characteristics similar to helium, being inert and lighter than air. Because hydrogen is the most abundant element both on Earth and throughout the universe, the abundance of energy available through this process is difficult even to imagine. For example, a cup of water contains enough hydrogen to produce over 3, kilowatt-hours of heat if you "collapse" the hydrogen atoms to one-twentieth of their normal size, or enough to provide all the energy needed for an average home - space and water heating plus electricity - for a month. With this kind of support, Mills is confident his company will soon complete a BlackLight Power cell that will produce a full kilowatt of heat. Once this is accomplished, it can quickly to bring to market a commercially viable energy cell. According to their inventors, some of these new devices produce four to six times as much mechanical energy as input electrical energy. In other words, once a machine achieves a certain threshold of revolutions per minute, it supposedly can be unplugged and serve as a free-running generator of electricity. A number of magnetic motors have been evaluated by Magnetic Power, Inc. None of these devices have yet proven to function over-unity under load. According to Magnetic Power, there are two eminent scientists whose work on magnetic devices may some day bear fruit: Harold Aspden in Great Britain, former patent counsel for IBM Europe, who is working on his version of a practical over-unity magnetic motor. Many of the devices developed by inventors have proven to be merely magnetic flywheels and are therefore in fact only a type of mechanical energy storage device. As our still incomplete understanding of magnetism continues to grow, it is possible that one day a design based on a new source of energy will prove practical. Roots, a subsidiary of Magnetic Power, is developing room temperature Ultraconductors. TM Made of highly conductive polymer materials, this technology may make possible the creation of very powerful, lightweight motors and generators without the use of iron or copper. Martin Fleischmann and Stanley Pons at the University of Utah startled the world with their claim that they were getting excess thermal energy far beyond electrical input energy from an electrochemical cell with a palladium cathode and a heavy water electrolyte. The cell output, they said, was substantially more than could be explained by any chemical reactions. In , a Department of Energy research panel, dominated by hot fusion advocates, proclaimed that no government funding should be invested in such a questionable area of research. Since then, following the lead of the scientific establishment, the media has generally either criticized or ignored cold fusion researchers. However, the evidence for the validity of cold fusion is growing stronger and stronger daily. The peer-reviewed published literature provides overwhelming support for both the nuclear-scale excess heat and nuclear changes in what were supposed to be exclusively chemically active systems. There have been reports of transmutations of heavy elements in various cold fusion experiments - both in ordinary water and in heavy water systems - potassium changed to calcium, rubidium to strontium, and palladium to silver, rhodium, ruthenium, etc. The Pons-Fleischmann process has been declared valid by Dr. Army has reviewed the pioneering cold fusion research of Dr. John Dash, a metallurgist from Portland State University in Oregon, and decided to fund his work for three years. Stanley Pons and Martin Fleischmann, despite overwhelming criticism heaped on them by US scientists and scoffing by American media, continued their work in France and England. With funding from a Toyota Foundation, they claim to have made excellent strides in the development of the heavy-water, palladium cathode, electrochemical cells. Currently, months of continuous testing of cells operating at boiling temperature has produced data showing thermal output of twice the input electrical power - all from a tiny palladium cathode. James Patterson, a scientist with a distinguished record of achievement. The Power Cell has produced kilowatt levels of thermal energy at more than twenty times the input electrical energy. It has been independently tested and replicated by several universities, utilities and corporate research laboratories. Motorola has tested a number of cells and found that with at least

one cell they were able to turn the input electrolysis power off, walk away, and have the output power of twenty watts thermal continue for at least a half a day. Perhaps the most astonishing finding from cold fusion research is the apparent observation of radioactivity reduction in the process! CETI, one of the first cold fusion companies, recently announced it had been awarded a US patent on an electrolytic process for reducing the radioactivity of thorium and uranium. The company claims its process can reduce the radioactivity of radioactive materials by over 90 per cent in periods less than 24 hours - compressing into hours what nature takes billions of years to do. He later tested the CETI power cell and found that it did indeed reduce the radioactivity of uranium and thorium. He cautions, however, that much more basic research needs to be done before this or any other process can be developed into a workable technology for dealing with nuclear waste. There are at least three other groups who also claim to be able to reduce radioactivity by other methods, which have yet to be awarded patents. One of them, the Cincinnati Group, is marketing to scientists a kit which demonstrates their transmutation process. If purchasers follow their suggested protocol and do not get the claimed results, their money will be refunded. It is the "catalytic fusion" process of MIT-trained chemical engineer Dr. Based on more than six years of painstaking research, Dr. A pre-treated activated carbon catalyst with 0. In tests conducted by Dr. Eugene Mallove of Infinite Energy magazine, it was confirmed that the Case process achieved a persisting excess temperature that climbed to It exhibits the heat-after-death phenomenon that many researchers have reported coming from cold fusion cells: If replication holds up, it may be impossible for anyone to deny Dr. Mallove believes the process looks well-positioned to be a simple commercial power-generating technology in small, distributed units, as well as in large power plants. An energy efficiency consultant from Georgia, Griggs invented the pump as a result of his curiosity about a common phenomenon called water hammer or cavitation. Griggs noticed that heat emanated from fluids, which flow quickly through the pipes of a boiler causing water pressure to drop in part of the pipe. Bubbles formed in the low-pressure areas collapse when carried to areas of higher pressure. The resulting shock waves collide inside the pipe bringing about the water hammer effect. When the rotor spins, water is forced through the shallow space between the rotor and the case. The resulting acceleration and turbulence created in the gap somehow heats the water and creates steam.

### 2: Miracle in the Void: The New Energy Revolution by Stephen Kaplan

*MIRACLE IN THE VOID is a photo-journalistic look at contemporary free energy development. In this gripping personal odyssey on the path toward greater understanding of our reality, Dr. O'Leary explains how free energy and other scientific revelations will profoundly shift our [www.enganchecubano.com](http://www.enganchecubano.com) highly.*

Created by inventors Dr. Paulo and Alexandra Correa at Labofex in Canada, the system is well on its way to commercialization for electric power generation in vehicles and in homes, solidly protected by U. S and foreign patents U. The Correas write conservatively: The cost of kWh kilowatt hours produced by this technology is estimated to be more than ten times cheaper than what is presently available from any other energy source. His high-density charge cluster device produces more than thirty times greater output than input energy. At first glance, they seem to violate a principle of physics that asserts that electrical charges, either positive or negative, repel each other. One of them, the Cincinnati Group, is marketing to scientists a kit which demonstrates their transmutation process. If purchasers follow their suggested protocol and do not get the claimed results, their money will be refunded. An energy efficiency consultant from Georgia, Griggs invented the pump as a result of his curiosity about a common phenomenon called water hammer or cavitation. Griggs noticed that heat emanated from fluids, which flow quickly through the pipes of a boiler causing water pressure to drop in part of the pipe. Bubbles formed in the low-pressure areas collapse when carried to areas of higher pressure. The resulting shock waves collide inside the pipe bringing about the water hammer effect. The OPEC Cartel, gas station lines, smog, oil spills, oil wars, nuclear accidents, nuclear proliferation and waste disposal were in the headlines and began to become known by the public U. Global warming from

greenhouse gases coming mainly from the burning of fossil fuels may be the most ominous sign of possibly irreversible damage. A growing consensus among mainstream climatologists is that the unprecedented persistence of El Nino conditions and resulting local weather extremes can be directly traced to overuse of oil and coal for electricity, heating and transportation. Incremental reforms such as emission controls, energy conservation and turning to renewable sources, while helpful, are clearly insufficient to stop, much less reverse, current trends. Widespread loss of life and deteriorating health throughout the world is caused by both the pollution and the weather shifts. Moreover, these conditions have led to an acceleration of airborne diseases that have already killed hundreds in the affected areas. Public health experts are warning that this may only be the beginning of widespread plagues. Some scientists have warned that global warming is also accelerating ozone depletion, an even more serious threat to life on Earth. Trends in energy use make the picture look more menacing. During the two decades, which have passed since the time the energy crisis first erupted, we have tripled oil consumption and doubled electricity use worldwide. Fortune magazine has noted that if the per capita energy consumption of China and India rises to that of South Korea which we believe is a realistic scenario, and the Chinese and Indian populations increase at currently projected rates, "these two countries alone will need a total of million barrels of oil a day. The Transition to a Free Energy Economy Free energy technology holds immense promise for alleviating or eliminating entirely the threat posed by fossil fuel and nuclear pollution. It will also allow all areas of the world, including both developed and developing economies, to meet increasing needs for energy without bringing about environmental disaster. The rate of invention and communication in the new energy field is accelerating rapidly. Thousands of experiments are being conducted around the world, some by inventors working alone and others by collaborative efforts. Granted, we are largely in the research phase of the research and development cycle, with no guarantees that any particular commercial system will become available within a certain time frame. Granted, too, there have been and will be many false starts and exaggerated claims. However, given the significant initiatives in cold fusion and other new energy technologies in the U. Japan may be first country to achieve a breakthrough to commercially available technology. With minimal domestic energy supply, Japan has little to lose and much to gain from developing new energy sources. There are more institutional barriers to, and less incentive for, the development of free energy in the United States. Yet work here is widespread, and projects are beginning to attract funding from a wide variety of investors, including utilities. The revolution in personal computing is helping to speed up the free energy revolution. A number of dynamic free energy discussion groups can be found on the Internet, characterized by spirited discussion of emerging issues and down-to-earth exchange of research data and suggestions. Because of the distinctive openness of Internet communication, cooperation among participating inventors and scientists almost certainly guarantees that potentially workable theories and processes will be widely replicated and tested. Furthermore, no central authority will be able to squelch progress, as it might have been able to do in the past when individual inventors almost always worked in isolation. We are in the midst of a scientific revolution of unprecedented magnitude. The necessity to overhaul our currently bankrupt energy systems to save the environment is an idea whose time has come. As we bring into existence new forms of power, we will bring about social and economic change unparalleled in human history. The situation we are in demands fresh perspectives and inspired leadership.

### 3: Miracle in the Void: The New Energy Revolution

*Stephen Kaplan has been working in the new energy field as a policy researcher and networker for six years. He was a legislative aide to Senator Gaylord Nelson of Wisconsin, working in the fields of economic opportunity, housing and energy, and an associate of the Adlai Stevenson Institute in Chicago.*

All truth passes through three stages: First, it is ridiculed. Second, it is violently opposed. Third, it is accepted as being self-evident! What I am about to discuss has been ridiculed by governments and the media for more than fifty years. In some instances it has been violently opposed. Put simply, it is the energy that drives the whole universe, from the smallest atom to the largest galaxy. Despite total lack of official recognition or support, Zero-Point Energy has been privately studied and researched for decades. In many instances this work has been carried on despite constant threats and suppression, especially prior to the 1970s. In part, here are some of the benefits of ZPE technology: It is unlimited, inexhaustible, and non-polluting. It is ecologically sound, with no deleterious waste products of any kind. It constitutes the ultimate in local, on-site, or on-board power. Every appliance can have its own in-built power supply. It has no cost other than its initial manufacture. It is simple and relatively inexpensive to manufacture and operate. It operates either continually or on-demand, with little or no maintenance. It allows inexpensive, efficient desalination of seawater for agriculture and other uses. It makes possible inexpensive heating, cooling, refrigeration, air-conditioning, and other formerly energy-intensive tasks. It is suitable for all forms of transport. With respect to item 10, it becomes evident that this technology will revolutionize transportation throughout the world. It opens up the possibility to "highways in the sky," where high-speed vehicles would be able to travel safely, guided by satellite navigation systems, from anywhere to anywhere, with practically no risk of collision. It also would allow us to decentralize from crowded cities, because people could easily and cheaply travel to and from remote regions. There is abundant information available about zero-point energy often referred to as "free energy" on the internet for anyone wishing to explore. The websites listed below are but a few of the many sources. Two excellent books that provide overviews of both the history and current reality of research being done on Zero-Point Energy and other technologies are also well worth viewing are two videos: Fire from Water available from Infinite Energy magazine. The coming conversion to a decentralized, free-energy economy appears to be inevitable. Thousands of free energy experiments are being conducted around the world, some by inventors working alone and others by collaborative efforts. Granted, we are in the research phase of the research-and-development cycle, with no guarantees that any particular commercial system will become available within a certain time frame. Granted, too, there have been and will be many false starts and exaggerated claims. However, given the significant research taking place in Japan, Germany, Italy, Russia, the United States, and elsewhere, there is little doubt that we will have extremely low-cost and non-polluting energy from zero-point or other processes in the very near future. This in turn is the result of many factors, chief among them: The opposition of the scientific establishment, threatened by the overturning of ruling paradigms in physics and their economic stake in existing technologies and pet research ventures for example, the failed "hot fusion" program. The opposition or benign neglect on the part of governments. The failure of the press to investigate properly both promising scientific developments and the vested interests which oppose progress. The inability of the environmental movement to consider new alternatives. The ignorance and apathy of the general public. Recent revelations of the Disclosure Project have put the U.S. This opposition has ranged from refusal to support research and denial of patents to security bans. While this has come about for a number of reasons, it is likely that one of them is the desire of the military-industrial complex to maintain a monopoly on the advanced energy and propulsion technologies created in covert programs. As is the case with all scientific revolutions, this one will eventually succeed. And when it does, we will be faced with the challenge of using and dealing with the consequences of energy sources which are unlimited, non-polluting, portable, available everywhere, and can be used to replace all other energy sources, including fossil fuels. The New Energy Revolution" connexion. ### 4: Miracle - Das Wunder von Lake Placid () - IMDb

*Dr. Brian O'Leary is a former NASA Astronaut and has taught Astro-Physics at Princeton and Cornell University. He's the author of over scientific papers and 5 books including "The Miracle In.*

This week-long hiatus from the blogosphere and social media helped me realize that fact. Since January, I added blogging to my own personal circus of activity. If I dip my toes in the water, my body inevitably dives in after. With the school year approaching and football practices gearing up, my anxiety was high. She calls me that often. How about I take the weekend? I need to take breaks to realize how invested I am in things. I do not push those icons, they push me. So, I have to take the icons off my phone. Even without them, I still find ways to push my limits. It was 98 degrees on the artificial turf our second day of practice. Players were coming off the field with 2nd degree burns on their hands. I was tired of watching my quarterbacks scoop the ball off the turf. Slide on it and keep possession! I slide a few yards, as if the dry hot turf were a slip-and-slide. Leg skin, the size of my palm, burns off my leg. I jump up as if nothing happened. I should know at this point to leave the demonstrations to the players. My drug and alcohol consumption never knew a limit. I was a blackout drinker. I am afflicted by the void of more. It says that I need to work more, write more, do more, be more. Thankfully, it no longer tells me to drink more. The void of more has also propelled me to do worthwhile things. Transferring the void of more to my passion for writing, teaching, and coaching is a good thing. Connecting with writers and folks in recovery at the speed of light through tubes across the globe has been a great thing. I missed the recovery posse this week. First, I must admit that moderation is as foreign to me as space travel. I admit that whatever I get into will consume my life. Next, I need to remove certain habits. In order to remove habits, I must remove the option to enact them. I put in my day notice at the paper last week. There is no flicking the off switch. I will continue to discover and distinguish which switches I want left on. I will never stop pushing the limits of family. Even when a bandage covers a palm-sized flesh wound, I will seek out new summits.

### 5: Miracle in the Void: Free Energy, Ufos and Other Scientific Revelations | eBay

*Miracle in the Void: The New Energy Revolution. Dr. Brian O'Leary, Hawaii and Stephen Kaplan, Portland, Oregon "Ere many generations pass, our machinery will be driven by power obtainable at any point in the universe it is a mere question of time when men will succeed in attaching their machinery to the very wheelwork of nature."*

Aug 23, Julie D. Is God seeing me? I could really relate to this book because I have been through such a journey recently. As the middle drags on, you wonder if it will ever end. This is where we can lose hope or even question if God is there for us. This book is for anyone who has ever started on a journey in life, or been thrown into a difficult situation and wonders if the middle part of this journey will ever end? This is where we can lose hope or even question if God is there for us. Charlotte shares from her life in this book and I always enjoy that. She also has Prayer Points and Action Points at the end of each chapter that are perfect for individual reflection. I understood what she meant by the title. Sometimes the miracle in the middle is just surviving it! I enjoyed this book and I learned a lot from it. I give it 4 out of 5 stars. The book began with a car trip example, and boy, could I identify. And yes, I agree, the middle of any trip always seemed the most difficult. And dare I say it? There are redeeming qualities to this book. If you are a runner, mountain-climber, or facing a large task or goal that seems insurmountable, there is encouragement to be found in sections of this book. You can get a lot out of just reading the pull quotes off each page. The prayer points at the end of each chapter are another plus. And once a destination is reached, you may be thankful and joyful. The difficult part is in the middle. Enter The Miracle in the Middle: She takes Mark 6 as main illustration. Jesus came to start a movement, not build a monument. Just as thousands of people are fed with bread and fish, Jesus commands to go. God provides the resources and instructions. He promises always to be with you. How do you navigate? What are your anchors? How much scope do you have? Charlotte uses many other biblical examples from Joseph, Abraham, David, Jonathan, Moses and the Hebrews, alongside personal stories from traveling, family life, and speaking engagements. Action points and questions for study are included. She has great suggestions but the practical ideas are lacking. One of her suggestions is to develop a strategy to change your situation but no plan is given. The best way to use this book, I think, would be to read it with a small group of trusted friends. There are Action and Prayer Points at the end of each chapter that would be good to use to develop strategy and work on the character traits needed. This is an encouraging book that should be read in preparation for being in the middle of a long journey. There are Action and Prayer Points at the end of each chapter that would be good to use to develop strategy and work on the character traits needed. Gambill does have a good section on helping others in the midst of a long journey so every Christian could benefit from reading the book. You can read my entire review at <http://> I received a complimentary galley of this book from the publisher for the purpose of an independent and honest review. Everybody has times in their lives where it feels like God has stopped talking to you. A desert experience if you will. And being in the desert can make you feel desperate and depressed. But this book reminded me that God is always there, and always will be. We walk by faith, not by our feelings. This book is a keeper for me, and will have a place in my bookshelf.

### 6: Miracle in the Void : Free Energy, UFO's and Other Scientific Revelations | eBay

*m miracle in the void CLICK HERE TO RENT IT FROM NETFLIX! Guest stars Tawny Kitaen, Bubba Smith, Wolfman Jack and Keri Russell join the malcontent Bundys for another season of outrageous antics in this smash-hit sitcom.*

All truth passes through 3 stages: First, it is ridiculed. Second, it is violently opposed. Third, it is accepted as being self-evident! What I am about to discuss has been ridiculed by governments and the media for more than 50 years. In some instances it has been violently opposed. Now it is time for the truth to be revealed so it can be accepted as self-evident, not just for its own sake but for the sake of this planet and all of its inhabitants. Put simply, it is the energy that drives the whole universe, from the smallest atom to the largest galaxy. Zero-Point Energy has been privately studied and researched for decades without official recognition or support. In part here are some of the benefits of ZPE technology: It is an unlimited and inexhaustible source of non-polluting energy. It is ecologically sound with no deleterious waste products of any kind. It allows inexpensive, efficient desalination of seawater for agriculture and other uses. It makes possible inexpensive heating, cooling, refrigeration, air-conditioning, etc. It is suitable for all forms of transport. This technology will revolutionize transportation throughout the world. It opens the possibility to "highways in the sky" where high speed vehicles would be able to travel safely, guided by satellite navigation systems, from anywhere to anywhere, with practically no risk of collision. It would also allow us to decentralize from crowded cities as people could easily and cheaply travel to and from remote regions. The web sites below are but a few of the sources for such information. Two excellent books provide overviews of both the history and current reality of research being done on zero-point energy and other technologies. Also, well worth viewing are two videos: Fire from Water both available from Infinite Energy magazine - [www.infiniteenergy.com](http://www.infiniteenergy.com). Thousands of free energy experiments are being conducted around the world, some by inventors working alone and others by collaborative efforts. Granted, we are in the research phase in a research and development cycle, with no guarantees that any particular commercial system will become available within a certain time frame. Granted, too, there have been and will be many false starts and exaggerated claims. This in turn is the result of many factors, chief among them the opposition of the scientific establishment threatened by the overturning of ruling paradigms in physics and their economic stake in existing technologies and pet research ventures. Recent revelations of the Disclosure Project put into a new light the long-standing opposition to civilian new energy research by the U.S. This opposition has ranged from refusal to support research, denial of patents, and security bans. While this has come about for a number of reasons, it is likely that one of them is the desire of the military-industrial complex to maintain a monopoly on the advanced energy and propulsion technologies created in covert programs. As is the case with all scientific revolutions, this one will eventually succeed. And when it does we will be faced with the challenge of using and dealing with the consequences of energy sources which are unlimited, non-polluting, portable, available everywhere, and can be used to replace all other energy sources including fossil fuels.

### 7: Miracle In The Void: The New Energy Revolution

*Miracle in the Void: The New Energy Revolution Dr. Brian O'Leary, Hawaii and Stephen Kaplan, Portland, Oregon "Ere many generations pass, our machinery will be driven by power obtainable at any point in the universe it is a mere question of time when men will succeed in attaching their machinery to the very wheelwork of nature."*

### 8: The Miracle in the Middle: Finding God's Voice in the Void by Charlotte Gambill

*Charlotte Gambill has an infectious love for life, a deep love for people, and a zealous love for God's House. Her passion is to build the local church "to see people reach their full potential and to strengthen leadership."*

### 9: Double Book Review | Klampert

*Enter The Miracle in the Middle: Finding God's Voice in the Void by Charlotte Gambill. She takes Mark 6 as main illustration. The disciples obeying to Jesus Christ's instructions and promise ending up in a storm at the Lake of Galilee.*
