Specifications[ edit ] Cutaway showing the location of the 12 kWh lithium-ion battery pack under the seats and fuel tank in the rear. Cutaway showing the location of gasoline-powered engine, generator, and front electric motor The plug-in hybrid has a 2. Located on the left side of the engine positioned transaxle-style , the front motor is a smaller, lighter, and higher output version of the permanent magnet synchronous electric motor used in the i-MiEV. It consists of 80 cells configured in series. Fuel economy in hybrid mode for Japan is 5. When charging at home the driver can choose between a standard 3-pin plug socket or via a dedicated EV charging point. From a standard plug, charging from empty to full charge takes about five hours. From a dedicated charging point at home or at a public charging point, it takes about 3. The drivetrain automatically selects one of three drivetrain modes for optimal performance and efficiency. In Series or Parallel drive modes, the generator produces electricity from the engine and stores it in the battery pack. The system works by continuously varying the timing of the intake valves, according to engine speed, when operating in "Parallel Hybrid" mode. The engine functions solely to generate electricity in "Series Hybrid" mode and is mainly used to provide motive force in "Parallel Hybrid" mode. The drivetrain switches to "Series Hybrid" when the energy level remaining in the battery pack is low or when the need arises for additional acceleration. In this mode the two electric motors are powered by the battery pack and the gasoline-powered generator. The vehicle can also switch to parallel hybrid mode. In this drive mode, the plug-in hybrid uses its full complement of available resources: This is the most efficient drivetrain mode under these types of driving circumstances. In addition, the plug-in hybrid has a set-up that allows the driver to control the strength of the engine braking with paddles behind the steering wheel. The driver switches on regenerative braking either by sliding the central selector to the "B" position, or by operating the paddles. For example, down a long but shallow slope it is better to keep rolling with a small level of recuperation, while down a steep hill, the driver can set the system to maximum regeneration. With minimum regen, the car would conserve momentum and coast without any power draw. In this driver-activated mode, the vehicle automatically conserves the energy within the drive battery pack by operating the vehicle in hybrid mode, running the engine when necessary to maintain the state of charge at around the same level as when the Save button was pressed. EV battery only and hybrid. The charging port is located in the rear right side. Charging cord plugged in the V port Gasoline-powered engine left and frontal power drive unit right Sales[ edit ] Sales began in Japan by late January , becoming the first SUV plug-in hybrid in the market. Mitsubishi plans to introduced a redesigned versions as a model year The latest delays are due to production constraints of the lithium-ion battery pack. Australia ranks among the top selling countries in the rest of the world with 2, units sold through March
