

1: State Trends in Perspective, 1st Edition

Nebraska Sports Headlines; Global Industry Analysis, Size, Share, Growth, Trends and as well as to distinguish the potential resources from a sales perspective in the global orange extract.

Unemployment numbers are strong, job growth is robust, foreclosures are under control, and the market is highly affordable. All of these add up to an economy that can survive moderate volatility. With continued growth, the Lincoln real estate market can be a model for other U. While the Lincoln housing market is below the national average, it has appreciated at a one year rate of Over the last 36 months, home prices appreciated Lincoln real estate is steadily rising at a sustainable pace. Every homeowner and potential seller wants to see an increase in value, but if it happens too quickly it may be artificial. The trend of positive price growth has continued since the recession, and shows no signs of slowing down. More homeowners in the Lincoln housing market have realized equity gains over the last three years. The same goes for Lincoln real estate investing. While many of these homeowners are not currently looking to sell, the increased equity provides increased options in the future. The following highlights how much equity has been gained relative to the year of purchase: The fact that the Lincoln real estate market was on par or, in some cases, exceeded the national average speaks to the strength of the market. There are many reasons that Lincoln real estate is so appealing to buy or invest in. The increased market demand may be the most appealing aspect for Lincoln real estate investing. This starts with how attractive an area it is to work in. Over the last twelve months, Lincoln has added over 5, new jobs. This number is up from the previous month of 4,; and greatly outpaces the national market average. The local unemployment rate currently sits at 2. Both of these figures represent a decrease from this same time a year ago. Lincoln also shows great promise in terms of job growth. The area is growing at a 1. In terms of unemployment and job growth, Lincoln is one of the strongest in the country. Few cities can boast better numbers. Lincoln real estate investing should benefit as a result. One of the ways to measure affordability is by the local monthly mortgage payment to income ratio. For the Lincoln housing market, that figure is only 7. This provides a level of affordability that most markets do not offer. With more homeowners comfortable in their employment, while having increased residual income, more money is free to move around the market. A stronger local economy leads to increased sales, which ultimately bump up property values. Another positive sign deals with the amount of new construction inventory on the market. Over the last twelve months, there were new housing permits in the market. This is a slight decrease from the same time a year ago, but it appears the market has bottomed out and is on the way up. Over the past three years, Lincoln far exceeds the national average for new housing permits. Lincoln real estate investing stands to benefit from the distressed property market. That said, RealtyTrac has identified homes in some state of foreclosure default, auction or bank-owned. While not high from a national perspective, it is percent higher than it was last year in the Lincoln housing market. With affordability so high, it is no surprise that the majority In other words, the homeowners are simply at risk of receiving notice. However, that does not mean the rest of the inventory cant offer great discounts for the Lincoln real estate investing community. Lincoln continues to be a stalwart in the real estate market. All markets go through periods of small correction. The best markets use this as a springboard for continued growth. With strong fundamentals and periods of sustained growth, the Lincoln housing market appears to be headed in the right direction. Sexual orientation and military service: A social science perspective. *American Psychologist*, 48 5 , Since , the policy of the U. Department of Defense has been that homosexuality is incompatible with military service. This article reviews the social science literature relevant to such a discussion. Empirical data suggest that lesbians and gay men are not inherently less capable of military service than are heterosexual women and men; that prejudice in the military can be overcome; that heterosexual personnel can adapt to living and working in close quarters with lesbian and gay male personnel; and that public opinion will be influenced by the way this issue is framed. Any change in policy should be accompanied by strong measures to prevent harassment and violence against lesbians and gay men, educate heterosexual personnel, and enforce uniform policies regarding all forms of sexual harassment. Considerations relevant to a new policy that does not discriminate on the basis of sexual orientation are discussed. You can request a reprint via e-mail. Back to bibliography Herek, G. Results from a national survey. *The Journal of Sex Research*, 30 3 , When asked whether any friends or relatives had "let you know that they were homosexual," approximately one-third of the respondents gave an affirmative answer. Regression analyses indicated that interpersonal contact predicted attitudes toward gay men better than did any other demographic or social psychological variable included in the equation. Interpersonal contact was more likely to be reported by respondents who were highly educated, politically liberal, young, and female. The data indicate that interpersonal contact is strongly associated with positive attitudes toward gay men and that heterosexuals with characteristics commonly associated with positive attitudes are more likely than others to be the recipients of disclosure from gay friends and relatives. Documenting prejudice against lesbians and gay men on campus: The Yale Sexual Orientation Survey. *Journal of Homosexuality*, 25 4 , College and university communities recently have begun to confront the problems of harassment, discrimination, and violence against lesbians, gay men, and bisexual people on campus. A first step in responding to attacks against gay and bisexual people is to document their frequency and the forms that they take. The present article reports the methodology and results of a survey conducted at Yale University in , which subsequently has been replicated on several other campuses. The Yale survey revealed that lesbians, gay men, and bisexual people on campus lived in a world of secretiveness and fear. Although experiences of physical assault on campus were relatively infrequent, many respondents reported other forms of discrimination and harassment. A majority reported that they feared antigay violence and harassment on campus, and that such fears affected their behavior. Replications on other campuses have yielded similar results. Suggestions are offered for researchers who wish to conduct such a survey on their own campus. A copy of the report on which this paper is based in PDF format can be downloaded from this site. Special attention is paid to the stigma that so closely accompanies HIV disease in the United States. Among the questions considered are whether AIDS attitudes are unidimensional or consist of multiple domains; whether AIDS attitudes in different domains have the same social psychological antecedents; whether these relationships are similar among different demographic groups; what psychological functions are served by AIDS attitudes; and how antigay prejudice combines with other factors to affect public reactions to AIDS. Data are presented from focus groups conducted in different cities and towns in the United States, as well as a national telephone survey. Conspiracies, contagion, and compassion: Trust and public reactions to AIDS. AIDS educational programs can be effective only to the extent that they are perceived as credible by their target audiences. In this study, public trust associated with AIDS was assessed in a national telephone survey. African Americans were more likely than Whites to express distrust of doctors and scientists concerning HIV transmission through casual contact, to believe that AIDS is being used as a form of genocide against minority groups, and to believe that information about AIDS is being withheld from the public. Individuals high in distrust did not differ from those low in distrust in their exposure to AIDS information. Higher levels of AIDS-related distrust were not related to self-reported personal risk reduction, but were

related to inaccurate beliefs about HIV transmission through casual contact and greater willingness to avoid and stigmatize people with AIDS. The importance of overcoming distrust in AIDS education programs is discussed. *The Journal of Sex Research*, 32 2 , The current article reports findings from a two-wave telephone survey with a national probability sample of Black heterosexual adults. Results indicated that negative attitudes toward homosexuality are widespread, but do not appear to be more prevalent among Blacks than among Whites. The single most important predictor of attitudes was the attribution of choice to sexual orientation: Consistent with previous research in predominantly White samples, respondents were more likely to express favorable attitudes if they were highly educated, unmarried, politically liberal, registered to vote, not religious, and if they included Blacks in their concept of gay men. In addition, respondents reported more favorable attitudes if they had experienced personal contact with gay men or lesbians, but this was not a significant predictor of attitudes when other variables were statistically controlled. A pre-publication version of the paper in PDF format can be downloaded from this site. You can also request a reprint via e-mail.

Identity and community among gay and bisexual men in the AIDS era: AIDS, identity, and community: The HIV epidemic and lesbians and gay men pp. This chapter reports data from two studies conducted in with gay and bisexual men from the greater Sacramento CA metropolitan area to identify principal predictors of high-risk sexual behaviors and various aspects of psychological functioning. Among the findings were: Men who were out of the closet, had positive feelings about their sexual orientation, and felt a sense of community with other gay and bisexual men were more likely to have the beliefs and attitudes that foster HIV risk reduction. A pre-publication version of the chapter in PDF format can be downloaded from this site. Some of the scales and measures used in this study are posted to the web site. *Personality and Social Psychology Bulletin*, 22 4 , At Wave 1, heterosexuals reporting interpersonal contact At Wave 2, these findings were generally replicated for attitudes toward lesbians as well as gay men. Cross-wave analyses suggest a reciprocal relationship between contact and attitudes. Theoretical and policy implications of the results are discussed, with special attention to the role of interpersonal disclosure in reducing stigma based on a concealable status.

Effects of direct and vicarious contact. *Journal of Applied Social Psychology*, 27 1 , Data are presented from a 2-wave national telephone survey with a probability sample of U. Some differences between the general population sample and the Black oversample were observed in the relative impact of direct and vicarious contact. Implications of the findings for reducing AIDS stigma are discussed.

Hate crime victimization among lesbian, gay, and bisexual adults: Prevalence, psychological correlates, and methodological issues. *Journal of Interpersonal Violence*, 12 2 , Although violence based on sexual orientation is now widely recognized as a serious problem in the United States, social science data concerning the prevalence and consequences of such crimes are limited. In the present study, questionnaire data about victimization experiences were collected from lesbians, gay men, and bisexuals 74 females, 73 males in the Sacramento CA area. In addition, 45 of the respondents participated in a follow-up interview. Forty-one percent reported experiencing a bias-related criminal victimization since age 16, with another 9. The distribution of bias-related victimization and harassment experiences in the sample resembled patterns reported in other U. Compared to other respondents, bias-crime survivors manifested higher levels of depression, anxiety, anger, and symptoms of post-traumatic stress. Methodological and substantive issues in empirical research on hate crimes against lesbians and gay men are discussed.

Correlates of internalized homophobia in a community sample of lesbians and gay men. *Journal of the Gay and Lesbian Medical Association*, 2, To systematically assess internalized homophobia and its correlates among gay men and lesbians. A measure of internalized homophobia IHP was administered to a community sample of lesbians and gay men, along with measures of psychological well-being, outness, and perceptions of community. For lesbians and gay men alike, internalized homophobia was associated with less self-disclosure to heterosexual friends and acquaintances and less sense of connection to the gay and lesbian community. Lesbians and gay men with the highest IHP scores also manifested significantly more depressive symptoms and higher levels of demoralization than others, and high-IHP men manifested lower self-esteem than other men. IHP scores were not associated with disclosure to parents or the recency of developmental milestones for either lesbians or gay men.

A conceptual framework and research agenda. Although widely recognized as a problem, AIDS stigma has not been extensively studied by social and

behavioral scientists. Empirical research is urgently needed in this area, however. Data are especially needed to inform government leaders, health providers, and the general public as they debate new policies concerning HIV treatment, prevention, and monitoring. The workshop, co-chaired by Gregory Herek and Leonard Mitnick of NIMH, was designed to promote consideration of empirical research and theory-building that would have both basic and applied scientific significance, including implications for policymakers and opinion leaders. The paper provides a conceptual framework for understanding AIDS stigma, and proposes a basic research agenda. A pre-publication version of the report in PDF format can be downloaded from this site. Symbolic prejudice or fear of infection? A functional analysis of AIDS-related stigma among heterosexual adults. *Basic and Applied Social Psychology*, 20 3 , Using responses to the Attitude Functions Inventory AFI , respondents were categorized according to the dominant psychological function served by their attitudes: Negative affect toward a person who contracted AIDS through homosexual behavior, support for mandatory testing of so-called high-risk groups, and support for other punitive AIDS policies were predicted mainly by attitudes toward gay men for heterosexuals with expressive attitudes but not for those with evaluative attitudes, a pattern labeled functional divergence. Behavioral intentions to avoid persons with AIDS in various hypothetical situations were predicted primarily by beliefs about contagion for heterosexuals with expressive and evaluative attitudes alike, a pattern labeled functional consensus. Implications for AIDS education and for research based on the functional approach to attitudes are discussed. Effects of source, message, receiver, and context. *American Journal of Community Psychology*, 26,

Introduction This TMR report on the global orange extract market analyzes opportunities in the market, and presents updates and insights relating to various segments of the global orange extract market over the forecast period. In terms of value, the orange extract market is expected to expand at a CAGR of 5. The report also comprises the study of current issues with consumers and opportunities for the orange extract market. Report Description The report explores the global orange extract market for the period. The overriding goal of this report is to provide insights into the developments in the global orange extract market that are progressively helping to transform worldwide businesses that are associated with the same. It is essential to consider that, in the wavering economy, we provide the estimated Y-o-Y year-on-year growth rate along with the Compound Annual Growth Rate CAGR for the overall forecast, to understand the better analysis and evaluation of the global orange extract market, and to discover the equitable opportunities. Yet another key feature of this report is the analysis of the global orange extract market and the corresponding revenue forecast is also carried out in terms of absolute dollar opportunity. This is generally neglected while forecasting the overall market. Absolute dollar opportunity analysis is highly essential in determining the degree of opportunity that a provider can observe to execute, as well as to distinguish the potential resources from a sales perspective in the global orange extract market. The global orange extract market report starts with an executive summary, and the definition of various segmentations involved and their respective shares in the global orange extract market. The report also includes the major macroeconomic factors with an outlook of orange extract in the global extract market. The report further highlights the market dynamics which covers the drivers, restraints, opportunities, and trends in the global orange extract market. The report also highlights the study of current issues with processing, and opportunities for orange extract market. It also includes value chain analysis that provides a detailed structural view of profitability from the manufacturer to the end user. In order to provide users with a comprehensive view of the global orange extract market, we have extended the competitive analysis of key market players and their strategic key developments. The competitive dashboard provides a detailed comparison of orange extract manufacturers on valuable parameters such as total revenue, key product offerings, key strategies, and key developments. The study emphasizes the global orange extract market attractiveness analysis by form, nature, end user, distribution channel, and region. To estimate the overall market size of orange extract, the report considers various preliminary aspects based on secondary research. Furthermore, it highlights quantitative analysis such as region-wise market shares, and market shares by form, nature, end user, distribution channel, and other qualitative inputs from primary respondents, which have been incorporated to arrive at accurate market estimations. The forecast presented in the orange extract market report arrives at the total revenue being generated, and expected revenue contribution in the future by the global orange extract market. Detailed profiles of global orange extract manufacturing companies are also included in the report to evaluate their long- and short-term strategies, key product offerings, and recent developments, as they have a significant effect in the global orange extract market. Segmentation The subsequent sections analyze the global orange extract market on the basis of form, nature, end user, distribution channel, and region, and presents a forecast for the period. The market is segmented as follows:
