

## 1: Notes for Production and Operation Management - POM by B Srinivasa Rao

*Production/Operation management is the process which combines and transforms various resources used in the production/operation subsystem of the organization into value added products/services in a controlled manner as per the policies of the organization.*

**Meaning of Production Management:** Production Management refers to the application of management principles to the production function in a factory. In other words, production management involves application of planning, organizing, directing and controlling the production process. The application of management to the field of production has been the result of at least three developments: Until the emergence of the concept of manufacturing, there was no such thing as management as we know it. It is true that people operated business of one type or another, but for the most part, these people were owners of business and did not regard themselves as managers as well, ii Essentially stems from the first, namely, the development of the large corporation with many owners and the necessity to hire people to operate the business, iii Stems from the work of many of the pioneers of scientific management who were able to demonstrate the value, from a performance and profit point of view, of some of the techniques they were developing.

**Definition of Production Management:** It is observed that one cannot demarcate the beginning and end points of Production Management in an establishment. The reason is that it is interrelated with many other functional areas of business, viz. Alternately, Production Management is not independent of marketing, financial and personnel management due to which it is very difficult to formulate some single appropriate definition of Production Management. The following definitions try to explain main characteristics of production management: It lays stress on materialistic features only. So that the resulting goods and services are produced in accordance with the quantitative specifications and demand schedule with minimum cost. According to this definition design and control of the production system are two main functions of production management. This definition explains the main areas of an enterprise where the principles of production management can be applied. This definition clearly points out that production management is not a set of techniques. It is evident from above definitions that production planning and its control are the main characteristics of production management. In short, the main activities of production management can be listed as: Functions of Production Management: The definitions discussed above clearly shows that the concept of production management is related mainly to the organizations engaged in production of goods and services. Earlier these organizations were mostly in the form of one man shops having insignificant problems of managing the productions. But with development and expansion of production organizations in the shape of factories more complicated problems like location and lay out, inventory control, quality control, routing and scheduling of the production process etc. This resulted in the development of production management in the area of factory management. In the beginning the main function of production management was to control labour costs which at that time constituted the major proportion of costs associated with production. But with development of factory system towards mechanization and automation the indirect labour costs increased tremendously in comparison to direct labour costs, e. The planning and control of all these activities required more expertise and special techniques. In modern times production management has to perform a variety of functions, namely: However, the responsibility of determining the output characteristics and the distribution strategy followed by an organization including pricing and selling policies are normally outside the scope of Production Management.

**Scope of Production Management:** The scope of production management is indeed vast. Commencing with the selection of location, production management covers such activities as acquisition of land, constructing building, procuring and installing machinery, purchasing and storing raw materials and converting them into saleable products. Added to the above are other related topics such as quality management, maintenance management, production planning and control, methods improvement and work simplification and other related areas.
