"Options as a Strategic Investment" provides a solid foundation in the basic properties and advantages of options, listed and non-equity, and goes on to detail scores of proven techniques and tactics for a wide array of market www.enganchecubano.com reflects today's market realities and the new innovative options products available.

There are many strategies available that limit risk and maximize return. With a little effort, traders can learn how to take advantage of the flexibility and power options offer. This is a very popular strategy because it generates income and reduces some risk of being long stock alone. The trade-off is that you must be willing to sell your shares at a set price: To execute the strategy, you purchase the underlying stock as you normally would, and simultaneously write or sell a call option on those same shares. In this example we are using a call option on a stock, which represents shares of stock per call option. For every shares of stock you buy, you simultaneously sell 1 call option against it. It is referred to as a covered call because in the event that a stock rockets higher in price, your short call is covered by the long stock position. Investors might use this strategy when they have a short-term position in the stock and a neutral opinion on its direction. Check out my Options for Beginners course live trading example below. In this video, I sell a call against my long stock position. The holder of a put option has the right to sell stock at the strike price. Each contract is worth shares. The reason an investor would use this strategy is simply to protect their downside risk when holding a stock. An example of a married put would be if an investor buys shares of stock and buys 1 put option simultaneously. This strategy is appealing because an investor is protected to the downside should a negative event occur. At the same time, the investor would participate in all of the upside if the stock gains in value. The only downside to this strategy occurs if the stock does not fall, in which case the investor loses the premium paid for the put option. With the long put and long stock positions combined, you can see that as the stock price falls the losses are limited. Yet, the stock participates in upside above the premium spent on the put. Check out my Options for Beginners course video, where I break down the use of a protective put to insure my gains in a stock. Both call options will have the same expiration and underlying asset. The trade-off when putting on a bull call spread is that your upside is limited, while your premium spent is reduced. If outright calls are expensive, one way to offset the higher premium is by selling higher strike calls against them. This is how a bull call spread is constructed. Watch me break down a bull call spread in my Advanced Options Trading course video below: In this strategy, the investor will simultaneously purchase put options at a specific strike price and sell the same number of puts at a lower strike price. Both options would be for the same underlying asset and have the same expiration date. It offers both limited losses and limited gains. An Alternative To Short Selling. The trade-off when employing a bear put spread is that your upside is limited, but your premium spent is reduced. If outright puts are expensive, one way to offset the high premium is by selling lower strike puts against them. This is how a bear put spread is constructed. This strategy is often used by investors after a long position in a stock has experienced substantial gains. This is a neutral trade set-up, meaning that you are protected in the event of falling stock, but with the trade-off of having the potential obligation to sell your long stock at the short call strike. Again, though, the investor should be happy to do so, as they have already experienced gains in the underlying shares. In my Advanced Options Trading course, you can see me break down the protective collar strategy in easy-to-understand language. This strategy allows the investor to have the opportunity for theoretically unlimited gains, while the maximum loss is limited only to the cost of both options contracts combined. A Simple Approach to Market Neutral. This strategy becomes profitable when the stock makes a large move in one direction or the other. Watch how I break down a straddle in easy-to-understand language, from my Advanced Options Course: This could, for example, be a wager on an earnings release for a company or an FDA event for a health care stock. Losses are limited to the costs or premium spent for both options. This strategy becomes profitable when the stock makes a very large move in one direction or the other. Watch me as I break down the mechanics of a strangle in plain, easy-to-understand language. This is an excerpt from my Advanced Options Trading course. Butterfly Spread All of the strategies up to this point have required a combination of two different positions or contracts. All options are for the same underlying asset and

expiration date. For example, a long butterfly spread can be constructed by purchasing one in-the-money call option at a lower strike price, while selling two at-the-money call options, and buying one out-of-the-money call option. A balanced butterfly spread will have the same wing widths. An investor would enter into a long butterfly call spread when they think the stock will not move much by expiration. Maximum loss occurs when the stock settles at the lower strike or below, or if the stock settles at or above the higher strike call. This strategy has both limited upside and limited downside. In this strategy, the investor simultaneously holds a bull put spread and a bear call spread. The iron condor is constructed by selling 1 out-of-the-money put and buying 1 out-of-the-money put of a lower strike bull put spread, and selling 1 out-of-the-money call and buying 1 out-of-the-money call of a higher strike bear call spread. All options have the same expiration date and are on the same underlying asset. This trading strategy earns a net premium on the structure and is designed to take advantage of a stock experiencing low volatility. Many traders like this trade for its perceived high probability of earning a small amount of premium. The further away the stock moves through the short strikes lower for the put, higher for the call, the greater the loss up to the maximum loss. Maximum loss is usually significantly higher than the maximum gain, which intuitively makes sense given that there is a higher probability of the structure finishing with a small gain. In this strategy, an investor will sell an at-the-money put and buy an out-of-the-money put, while also selling an at-the-money call and buying an out-of-the-money call. It is common to have the same width for both spreads. The long out-of-the-money call protects against unlimited downside. The long out-of-the-money put protects against downside from the short put strike to zero. Profit and loss are both limited within a specific range, depending on the strike prices of the options used. Investors like this strategy for the income it generates and the higher probability of a small gain with a non-volatile stock. The maximum gain is the total net premium received. Maximum loss occurs when the stock moves above the long call strike or below the long put strike. Trading Center Want to learn how to invest?
