*A thought-provoking collection of ten lively essays outlining the teachings of the Lubavitcher Rebbe on subjects of particular interest to women - social involvement, equal rights, family planning, enlightened parenting, women's Torah study and observance, and many other topical subjects.*

Follow Data creation is a lengthy task that requires a lot of effort. And all you hope then is someone that can help and save you from this tedious task. MDT allows you to allocate fixed values to fields in any given object. This enables you to create data with minimum data entry. This template contains other MDT templates which enables me to create both Technical and Business Data in a single execution. All objects are deactivated during the initial creation. Activate Object Node The red dot indicates services that need to be defined with the exception of dynamic node, which will be explained later Step 2: For key field e. HAUS , always declare it as a Parameter in order to retrieve the object key after the execution. You can use this option if value is to be determined during run time. You can use Virtual evaluation category in which you can maintain user-defined Function Module. Function modules for virtual attributes must have a pre-defined interface. This is very common as we always have to deal with device of multiple registers. So next question that might arise: It would be silly to do that. SAP comes with a cool feature called Dynamic Node just for you to handle that scenario. To use this feature, you need to define Dynamic Node on the object level and field level as boxed below. Treat these dynamic fields as optional fields "€" if there is no input supply to these fields, the entire node will not be executed. Also observed that the nodes are now shown as red even though all mandatory fields have been defined. The red status does not indicate that the node is in error. Please refer to Notes Observe that this is a single register device installation. Hope you find this document useful.

Shutterstock Images Success in any organization is based upon its employees and their ability to work together as a team. As much as any manager would love for this to happen organically, it takes a lot of work to get individuals at various levels with divergent personalities and skill sets all operating as a cohesive whole. Following these seven recommendations will help any organization generate true teamwork: Create a "We" Culture Team building starts at the top. If senior executives encourage an environment where the organization uses less "I" and more "we" in how they communicate, everyone will feel supported, included and important to the organization. When counseling clients, use terms like "we believe Clearly Define Roles and Personal Growth Plans When individuals know what their role and responsibilities are, there is far less competitiveness in an organization. It allows employees to come together as a team in an enriching environment where everyone can contribute creatively and strategically. In addition, when employees understand what expectations exist for them to rise to the next level they are more apt to be a good team player, because they understand that they are really competing with themselves, and not their colleagues, for success. Recognize Success, Regardless of Its Origin The worst organizations are those that think good ideas or successful programs only come from senior-level individuals. Conversely, good organizations encourage creative thinking from all levels and give credit when a creative idea or solution comes from junior or mid-level employees. This is one of the most crucial components of developing a teamwork-based culture. Educate, Train and Role Play Teachable moments happen every day in every organization. If you want your organization to operate like a team, take advantage of opportunities to train and educate your employees in best practices. We do a lot of role playing and situational training to teach junior staff better ways to handle situations. When the culture is driven by "getting-better" in a non-competitive way, you breed teamwork. Win and Lose as a Team Accomplishments or failures should always be shared as a team. When there is a big account win, it is great to acknowledge all of the creativity, hard work, and commitment the entire team put into the win. Conversely, when the organization experiences failure of any nature, the worst situation is to fault any one person for that misstep. This is the quickest way to de-motivate an individual and it usually erodes confidence in an organization when others hear of it being handled this way. Encourage Social Get-togethers One of the best ways for employees to feel attached to an organization is to get to know each other on a more personal level. However, the organization must let employees know that it supports their participation for it to work. When individuals are more personally attached to each other, they are more comfortable working together, which helps to build teamwork. Develop Team-building Exercises and Programs I have long believed that information is power. We have done scavenger hunts, "Survivor" and "Amazing Race"-style competitions, and a variety of other programs designed to bring people together in both a social and fun, competitive environment. These team-building exercises have become some of the most important and memorable within our organization. It requires dedication from the organization to lay a foundation of building blocks that cause employees to want the same thing. With both sides working toward this common goal, true teamwork can be achieved. Feb 5, More from Inc.

### 3: Dynamic Partner Links and Dynamic Addressing (BPEL Designer and Service Engine User's Guide)

Read "A Partner in the Dynamic of Creation" by Menachem M Schnerson with Rakuten Kobo. *Womanhood in the Teachings of the Lubavitcher Rebbe* A thought-provoking collection of ten lively essays outlining the tea.

The Basic Activities Dynamic Partner Links and Dynamic Addressing During the design-time of an application, you may need to configure certain services whose endpoints addresses are not known beforehand, or it may be necessary to change an endpoint reference while the application is running. The Dynamic Partner link feature allows you to dynamically assign an endpoint reference to the partner link. This means that you can use one partner link for subsequent calls to different web-services provided that the services use the same interface. Assigning an Endpoint Reference Each partner link defines abstract information and concrete information. While abstract information, describing the web-service interface, should be static, the concrete information, such as the address and port, can be discovered and used dynamically. Note " For successful deployment of the process, a partner link should be completely defined. When you deploy the project, the WSDL file for the partner link should contain and define both the abstract and the concrete information for the partner link, including address and port, though later the concrete information can be changed independently from the WSDL file. The EPR information can be provided in several different ways: Use literal to construct endpoint: Provide the endpoint address as literal syntax and map it to the partner link. Use an incoming message to extract the endpoint address: Define the message with the end point schema as part of it, and use the message variable to assign the endpoint to the partner link at runtime. Using a database query to provide an endpoint address The BPEL service does a dynamic addressing invocation, with the address coming from a database. Each of these options is explained in more detail in the advanced section of this book. To assign the EPR to a partner link, use the message variable. In the target tree on the right, find the partner link to which you want to deliver a new concrete part. In the source tree, find a variable containing the new endpoint address. The address of the web-service can be defined in terms of different schemas, and the JBI container requires a special data type called ServiceRefType which is a simple wrapper for any endpoint-describing data type. To wrap your data: A new concrete part is assigned to the partner link. When the WS-Addressing schema is used for the first time it is copied from NetBeans global catalog to the BPEL Module project source root and further the project refers to the local copy of the schema.
