Objectives. After reading Chapter 20 you will be able to: Select the fabrics best for bias-cut dresses. Describe the clothing revolution created by Madeleine Vionnet.

Tuesday, January 3, Pattern Making Tips: In I moved it to this blog and backdated it to the approximate date that it was first posted. Basic Patternmaking Terms Flat patternmaking: The fabric is removed from the dress form and traced on to pattern paper to make a usable pattern. I am not very experienced in draping so I will not discuss it in this series. For example, I have altered my basic hoodie block into many other hoodie styles: This is complicated and requires a lot of math. I can grade simple patterns by myself, but for complicated patterns I create my own grading specifications and then pay a professional pattern grader to do the work. For example, for my tank top pattern I gave the pattern grader a size medium to start out with and then had her grade it into sizes XS, S, L, and XL. A digitizer is used to transfer a paper pattern into the computer program and a plotter will print out the finished pattern. The photo above is a screenshot of an assignment I did at school. You can learn computer patternmaking in fashion schools and some companies will rent out a student version of the program. I loved the classes and I wish I could use Optitex for all of my patterns. To use these programs you need to know the basics of patternmaking because they will not make the patterns for you. You need to cut your patterns to line up with the grain or else the fabric will stretch in random places and not hang the way you intended. Some fabrics have a grain that is easy to spot, like the fabric below: The lengthwise grain parallel with the selvedge, or edge of fabric is called the warp. It is usually more stable than the crosswise grain, which means that it does not stretch or move around as much. It also tends to shrink more than the crosswise grain when you sew with a type of fabric that shrinks in the wash. Most clothing is cut with the hemline perpendicular to the warp. The crosswise grain perpendicular to the selvedge, or warp is called the weft. It usually stretches more than the warp, even with woven fabrics that are not made to stretch. Most clothing is cut with the hemline parallel to the warp. On woven fabrics the bias is the direction that will usually have the most stretch. You can cut garments at the true bias a 45 degree angle from the warp and the weft and completely change the way that the garment hangs. Bias cut is a popular way to make evening-wear because it can make woven satin fabric stretch and cling in an elegant way. If you want to look for examples of what you can do with bias cut, check out dresses by Madeleine Vionnet. She was the first to popularize bias cut dresses. The photo below shows a piece of fabric with the selvedge running along the left side and the different grain directions labeled. When I position my pattern pieces for cutting, I double-check that the pieces are aligned with the fabric grain by comparing the fabric grain to the pattern piece grainline with an 18" C-thru ruler. Pattern pieces are usually cut with the grainline running parallel to the selvedge warp. Pattern Making Tools Special patternmaking tools can be expensive but they are not totally necessary when you start out. If you are willing to splurge on a full set of tools, Atlas-Levy sells a great set of them: These are available in longer lengths but I find that the longer ones are bulky and annoying. Taking body measurements to get accurate measurements, hold the tape measure around your body so that it stays in place but does not cut into your skin Measuring the length of a curved seam for when a regular ruler will not bend around the curve 18 inch C-Thru Ruler: Adding accurate seam allowances to pattern pieces Making straight lines and grainlines on pattern pieces that are shorter than 18 inches L-Square: Large L-squares 24 inches are great for making grainlines that are perpendicular to the hem of a pattern pieces. It is showing that the hem of the sleeve is perpendicular to the sleeve grainlines. This is important for tracing out accurate grain-lines. Professional patternmakers own many rulers that are much longer than 36 inches. Currently my longest pattern piece is my leggings pattern, which is under 36 inches so I do not need anything longer. The 36" long ruler is shown on the far left of this picture: Trace grainlines and style lines from one pattern piece to a new piece of paper you will need to do this when copying a pattern to thicker paper or copying a pattern to make changes without destroying the original copy Mock-up an existing garment by tracing stylelines through the garment to a new piece of paper Pattern Notcher: Notches are used to match up seams and to mark placement of design details like pleats and gathers. Once the pattern is finished and perfected, you can transfer it to oaktag also called manila pattern paper.
