Timothy 28th Jul The facts appear to be that there has never been a civilian aircraft involved in a mid-air in uncontrolled IMC whereas tens or hundreds have been involved in collisions in VMC and that the last time there was a military collision was in , when there were many more aircraft around. For extended periods arguably it is both, but not as dangerous or foolish as making it mandatory.: For extended periods arguably it is both But that is my point, there seems to be no historical evidence to support that view. From an actuarial point of view, flying in VMC is demonstrably far more dangerous. But that is an argument for another place. I am interested here in historical fact. DCDriver 28th Jul Prior to this tragedy, the RAF never published details of low-level routes around the UK - this accident changed all that and gave rise to notification of such exercises in advance. Dan Winterland 29th Jul That would fit your category civilian aircraft in IMC outside controlled airspace. BEagle 29th Jul Relying on statistics may well make you one, Timothy. Please tell us where you would intend to put your daft theory to the test, so that those with more sense will not be endangered by you. ORAC 29th Jul There was also the case of 2 GR1s which met nose to nose going opposite directions at night. It turned out to be a coin one of the crew had had in his pocket. I think it was the first of the two below, can remember the second but not if it was night IMC. Also a couple of Javelin night collisions here: Timothy 29th Jul I fly in uncontrolled IMC much of the time, as I have done for the last 35 years. So do many, many other people. It is why IFR is not limited to controlled airspace in this country. Please look it up. ORAC, thank you, I will look into all of those.
