Does humanity have a future beyond Earth? We should surely wish these pioneer settlers good luck in using all the cyborg techniques and biotech to adapt to alien environments. Within a few centuries they will have become a new species: Travel beyond the solar system is an enterprise for posthumans—organic or inorganic. When and where do you think we will find extraterrestrial life? If an alien life-form differs much from what we have here on Earth, it is going to be difficult to detect. Europa is a water world where more complex forms of life may have evolved. And Titan is probably the most interesting place in the solar system to look for life. It is rich in organic molecules but very cold and has no liquid water; if life exists on Titan, it will be very different from life on Earth. Cleland, philosophy professor and co-investigator in the Center for Astrobiology at the University of Colorado Boulder 3. Will we ever understand the nature of consciousness? Yet there is little rationale for buying into such defeatist talk and every reason to look forward to the day, not that far off, when science will come to a naturalized, quantitative and predictive understanding of consciousness and its place in the universe. Will the entire world one day have adequate health care? Deep in the rain forest, where people are cut off from transportation and cellular networks, mortality is the highest, access to health care is the most limited and quality of care is the worst. The World Health Organization estimates that one billion people go their entire lives without seeing a health worker because of distance. Health workers recruited directly from the communities they serve can bridge the gap. They can even fight epidemics such as Ebola and maintain access to primary care when health facilities are forced to shut their doors. My organization, Last Mile Health, now deploys more than health workers in communities across nine districts in partnership with the government of Liberia. If the global community is serious about ensuring access to health care for all, it must invest in health workers who can reach the most remote communities. Will brain science change criminal law? The implications of this for criminal law are absolutely nil. For one thing, all mammals and birds have circuitry for self-control, which is modified through reinforcement learning being rewarded for making good choices, especially in a social context. Criminal law is also about public safety and welfare. Even if we could identify circuitry unique to serial child rapists, for example, they could not just be allowed to go free, because they would be apt to repeat. And when rough justice takes the place of a criminal justice system rooted in years of making fair-minded law, things get very ugly very quickly. What is the chance Homo sapiens will survive for the next years? And the current bugaboo, in which our electronic progeny exceed us and decide they can live without us, can be avoided by unplugging them. Are we any closer to preventing nuclear holocaust? A nuclear terrorist event could kill , people. Three decades after the end of the cold war, however, the larger danger of a nuclear holocaust involving thousands of nuclear explosions and tens to hundreds of millions of immediate deaths still persists in the U. Remembering Pearl Harbor, the U. Because the flight time of a ballistic missile is only 15 to 30 minutes, decisions that could result in hundreds of millions of deaths would have to be made within minutes. This creates a significant possibility of an accidental nuclear war or even hackers causing launches. If there is a nuclear war, however, U. Will sex become obsolescent? This will allow easy preimplantation genetic diagnosis on a large number of embryos—or easy genome modification for those who want edited embryos instead of just selected ones. Could we one day replace all of the tissues in the human body through engineering? Vacanti; Scientific American, September]. All of these are coming to pass, either as real products or in clinical trials. Over the next few centuries it is quite possible that nearly every tissue in the body may be able to be replaced by such approaches. Creating or regenerating tissues such as those found in the brain, which is extremely complex and poorly understood, will take an enormous amount of research. The greatest cause of species extinction is loss of habitat. Overall, an extension of environmental science to include the living world should be, and I believe will be, a major initiative of science during the remainder of this century. Can we feed the planet without destroying it? Will we ever colonize outer space? Even some limited degree of reproduction might be feasible, recognizing that primates will be primates. We

currently have a very inadequate understanding of how to build closed ecosystems that are robust to perturbation by introduced organisms or nonbiological events Biosphere 2, for example , and I suspect that the contained ecosystem problem will turn out to be much more challenging than the vast majority of space colonization advocates realize. There are a wide range of technical problems to solve, another being air handling. Conley, NASA planetary protection officer Will we discover a twin Earth? We just have to look for them. We have now started prevention trials that are testing biological interventions even before people show clinical symptoms of the disease. Most important, that would mean that many older people could die while out ballroom dancing rather than in nursing homes. Will we use wearable technologies to detect our emotions? Wearable technologies let us quantify the patterns in these signals over long periods of time. In the coming decade wearables will enable the equivalent of personalized weather forecasts for our health: Increase sleep to greater than or equal to nine hours per night and maintain current low-moderate stress, for a 60 percent reduced likelihood of seizure in the next four days. Over the next 20 years, wearables, and analytics derived from them, can dramatically reduce psychiatric and neurological disease. Will we ever figure out what dark matter is? Some forms of dark matter allow detection through small interactions with ordinary matter that have so far evaded detection. Others might be detectable through their influence on structures such as galaxies. Will we get control of intractable brain diseases like schizophrenia or autism? Some interpret this to mean future answers lie purely in biochemistry, not neural circuits. Others argue the key is for the neuroscientist to start to think in terms of overall brain architectureâ€”not specific neural failures. Will technology eliminate the need for animal testing in drug development? That will eventually lead to significant reductions in use of animal testing. Importantly, these devices also will open up new approaches to drug development not possible with animal models today, such as personalized medicines and development of therapeutics for specific genetic subpopulations using chips created using cells from particular patients. Will gender equality be achieved in the sciences? We need to fix the institutions by implementing dual-career hiring, family-friendly policies, and new visions of what it means to be a leader. And, most importantly, we need to fix the knowledge by harnessing the creative power of gender analysis for discovery and innovation. Do you think we will one day be able to predict natural disasters such as earthquakes with warning times of days or hours? Hurricanes approach over days, volcanoes often build up to an eruption over days to hours, tornadoes strike within a few minutes. Earthquakes are perhaps the greatest challenge. What we know about the physics of earthquakes suggests that we will not be able to predict earthquakes days in advance. But what we can do is predict the damaging ground shaking just before it arrives and provide seconds to minutes of warning. Not enough time to get out of town, but enough time to get to a safe location. This article was originally published with the title "20 Big Questions about the Future of Humanity" Advertisement.

The Key to a Future-Proof City Learn how technology and data analytics are driving change for 3 critical areas that will make your city more efficient, sustainable, inclusive and resilient. At the same time, each local community is faced with the challenge to strengthen and renew the foundation their forebears built, so their children and grandchildren have the chance to achieve the American dream. While our cities have been engines of growth for centuries, this current generation has an historic opportunity to make this growth more sustainable and inclusive – so that the rungs on the ladder of success are more available to more citizens. A century ago there was a movement called the City Beautiful Movement that sought to make cities more beautiful and democratic. Fast forward to and there is a new movement called the City Possible Movement that seeks to make cities better today and to make better cities for tomorrow – a tomorrow that will be exponentially more urban. The City Possible Movement leverages world-class technologies that drive commerce, business, jobs, good governance, and growth on the one hand, while providing greater quality of life and equality of opportunity for more people on the other hand. At the center of the City Possible is municipal leadership that comes in the form of mayors, city councilmen and women, city planners, economic development officials, representatives of businesses large and small, and more. It is these leaders who hold the keys to making the City Possible a reality, working with and for their citizens. There are three keys that many municipal leaders are already focused on that are vital to advancing this idea of the City Possible. Making cities more inclusive. Making cities more connected. And making cities more sustainable. One of the seminal opportunities of our time is to make cities more inclusive. What many of us take for granted, i. Establishing a digital identity is often the first step for citizens to receive social benefits and to get access to public services such as libraries and transit systems. Acquiring identification and receiving social benefits electronically or digitally helps people – many of whom are unbanked – have a way to receive, store, access, and use their money. Electronic or digital receipt of funds can also help toward building up a credit score which enables people to get a loan to buy a car, go to school, start a business, or expand a business. Employees who receive their salaries in an electronic format are able to save their money in a more secure and more formal way. And for cities, paying salaries and social benefits electronically provides city government with increased efficiency and insurance that the right amount in funds is being received by the right person. Access to basic financial tools because of identity can be a create equalizer. The role of the public sector is indispensable. But increasingly the private sector has a vital role to play as well. The private sector can help drive ease and convenience for consumers through products and services, especially by adopting a mind-shift toward creating more products and services with cities in mind. There are opportunities to make daily commutes more efficient and more hassle-free. The first key that municipal leaders hold in advancing the City Possible is inclusion. The second key is connectivity. Quality of Life – Making Your City More Connected In many cities, mobility models were designed for cars and therefore lack the necessary integration across different modes of transport. In many of the largest U. Think of each of these steps and the extra time and expense added to the daily lives of each commuter. Think of the international tourists who come to a city, ready to explore, only to be confronted with a new tariff and ticketing system. Congestion and pollution also pose substantial health risks – vehicles account for 75 percent of carbon monoxide emissions in the US – affecting the most vulnerable populations. This transformation from driver to transit user becomes all the more urgent as urbanization levels increase and roads become even more congested. Enrique Penalosa, Mayor of Bogota, went so far as to say: Transport for London has reduced the cost of collecting fares from about 14 to just below 9 percent by enabling bank cards to be used directly at the turnstile. Those are savings that the city of London can reinvest in other areas to the benefit of its citizens. Both are also inextricably linked to increased sustainability, especially when it comes to urban transit. Most transportation systems are designed for the peak of peaks, which requires a higher investment of public funds at a time when public resources are

scarce. Through active demand management, cities can delay their next large scale infrastructure investment by years, delivering significant savings. Data analytics can enable transit authorities to nudge their users into off-peak routes using a mixture of information and incentives. Large urban transit systems could save hundreds of millions simply by diverting percent of passengers to less busy routes at peak times. When Singapore offered free rides to those traveling before the morning rush-hour at 6am , 7 percent of customers shifted out of the peak commute. Advanced data analytics can also guide economic growth and urban planning. The analytics from spending flows can help identify and predict patterns of commercial activity “enabling city planning and commercial real estate to better understand the relationship of how people move around and buy. This insight can then be used to guide planning decisions such as deciding where city centers, businesses and retailers should be located. Data derived from transit and retail outlets can help inform more inclusive and more sustainable urban planning around critical areas such as housing, transportation and energy management as well. Conclusion In the 21st century, urban leaders have a generational opportunity to make their cities more inclusive, connected, and sustainable by harnessing digital technologies and related data insights in an even fuller, deeper way. Realizing the City Possible requires collaboration across industries, sectors and geographies and the leadership of organizations such as C40, as well as governments at all levels. There are no greater stewards of that promise than municipal leaders in both government and business. About the Author Mastercard is a technology company in the global payments industry. Possible Future D&D Storylines. I do indeed believe that this will change and the Red Wizards will carry a key antagonist role in an upcoming D&D.

Past and future "entities" are construed as logical constructions or fictions. Saint Augustine proposed that the present is a knife edge between the past and the future and could not contain any extended period of time. Contrary to Saint Augustine, some philosophers propose that conscious experience is extended in time. For instance, William James said that time is "Other early philosophers who were presentists include the Buddhists in the tradition of Indian Buddhism. A leading scholar from the modern era on Buddhist philosophy is Stcherbatsky, who has written extensively on Buddhist presentism: Ultimately real is only the present moment of physical efficiency [i. Please help improve this section by adding citations to reliable sources. Unsourced material may be challenged and removed. October Learn how and when to remove this template message Human behavior is known to encompass anticipation of the future. Anticipatory behavior can be the result of a psychological outlook toward the future, for examples optimism, pessimism, and hope. Optimism is an outlook on life such that one maintains a view of the world as a positive place. People would say that optimism is seeing the glass "half full" of water as opposed to half empty. It is the philosophical opposite of pessimism. Optimists generally believe that people and events are inherently good, so that most situations work out in the end for the best. Hope implies a certain amount of despair, wanting, wishing, suffering or perseverance" i. Pessimism as stated before is the opposite of optimism. It is the tendency to see, anticipate, or emphasize only bad or undesirable outcomes, results, or problems. The word originates in Latin from Pessimus meaning worst and Malus meaning bad. Religion[edit] Religions consider the future when they address issues such as karma, life after death, and eschatologies that study what the end of time and the end of the world will be. In religion, major prophets are said to have the power to change the future. Common religious figures have claimed to see into the future, such as minor prophets and diviners. The term "afterlife" refers to the continuation of existence of the soul, spirit or mind of a human or animal after physical death, typically in a spiritual or ghostlike afterworld. Deceased persons are usually believed to go to a specific region or plane of existence in this afterworld, often depending on the rightness of their actions during life. Some believe the afterlife includes some form of preparation for the soul to transfer to another body reincarnation. The major views on the afterlife derive from religion, esotericism and metaphysics. There are those who are skeptical of the existence of the afterlife, or believe that it is absolutely impossible, such as the materialist-reductionists, who believe that the topic is supernatural, therefore does not really exist or is unknowable. In metaphysical models, theists generally believe some sort of afterlife awaits people when they die. Atheists generally do not believe in a life after death. Members of some generally non-theistic religions such as Buddhism, tend to believe in an afterlife like reincarnation but without reference to God. Agnostics generally hold the position that like the existence of God, the existence of supernatural phenomena, such as souls or life after death, is unverifiable and therefore unknowable. Eschatology is a part of theology and philosophy concerned with the final events in the history of the world, or the ultimate destiny of humanity, commonly referred to as the end of the world. While in mysticism the phrase refers metaphorically to the end of ordinary reality and reunion with the Divine, in many traditional religions it is taught as an actual future event prophesied in sacred texts or folklore. More broadly, eschatology may encompass related concepts such as the Messiah or Messianic Age, the end time, and the end of days. Grammar[edit] In Grammar, actions are classified according to one of the following twelve verb tenses: Verbs in the future continuous tense indicate actions that will happen beyond the present and will continue for a period of time. Verbs in the future perfect tense indicate actions that will be completed at a particular point in the future. Finally, verbs in the future perfect continuous tense combine the features of the perfect and continuous tenses, describing the future status of actions that have been happening continually from now or the past through to a particular time in the future. Another way to think of the various future tenses is that actions described by the future tense will be completed at an unspecified time in the future, actions described by the future continuous tense will keep

happening in the future, actions described by the future perfect tense will be completed at a specific time in the future, and actions described by the future perfect continuous tense are expected to be continuing as of a specific time in the future. Linear and cyclic culture[edit] The linear view of time common in Western thought draws a stronger distinction between past and future than does the more common cyclic time of cultures such as India, where past and future can coalesce much more readily. Davis Future studies or futurology is the science, art and practice of postulating possible, probable, and preferable futures and the worldviews and myths that underlie them. Futures studies seeks to understand what is likely to continue, what is likely to change, and what is novel. Part of the discipline thus seeks a systematic and pattern-based understanding of past and present, and to determine the likelihood of future events and trends. A key part of this process is understanding the potential future impact of decisions made by individuals, organisations and governments. Leaders use results of such work to assist in decision-making. It includes analyzing the sources, patterns, and causes of change and stability in the attempt to develop foresight and to map possible futures. Modern practitioners stress the importance of alternative and plural futures, rather than one monolithic future, and the limitations of prediction and probability, versus the creation of possible and preferable futures. Three factors usually distinguish futures studies from the research conducted by other disciplines although all disciplines overlap, to differing degrees. First, futures studies often examines not only possible but also probable, preferable, and "wild card" futures. Second, futures studies typically attempts to gain a holistic or systemic view based on insights from a range of different disciplines. Third, futures studies challenges and unpacks the assumptions behind dominant and contending views of the future. The future thus is not empty but fraught with hidden assumptions. Futures studies does not generally include the work of economists who forecast movements of interest rates over the next business cycle, or of managers or investors with short-term time horizons. Most strategic planning, which develops operational plans for preferred futures with time horizons of one to three years, is also not considered futures. But plans and strategies with longer time horizons that specifically attempt to anticipate and be robust to possible future events, are part of a major subdiscipline of futures studies called strategic foresight. The futures field also excludes those who make future predictions through professed supernatural means. At the same time, it does seek to understand the models such groups use and the interpretations they give to these models. Forecasting Forecasting is the process of estimating outcomes in uncontrolled situations. Forecasting is applied in many areas, such as weather forecasting , earthquake prediction , transport planning , and labour market planning. Due to the element of the unknown, risk and uncertainty are central to forecasting. Statistically based forecasting employs time series with cross-sectional or longitudinal data. Econometric forecasting methods use the assumption that it is possible to identify the underlying factors that might influence the variable that is being forecast. If the causes are understood, projections of the influencing variables can be made and used in the forecast. Judgmental forecasting methods incorporate intuitive judgments, opinions and probability estimates, as in the case of the Delphi method , scenario building , and simulations. Prediction is similar to forecasting but is used more generally, for instance to also include baseless claims on the future. Organized efforts to predict the future began with practices like astrology , haruspicy , and augury. These are all considered to be pseudoscience today, evolving from the human desire to know the future in advance. Modern efforts such as future studies attempt to predict technological and societal trends, while more ancient practices, such as weather forecasting, have benefited from scientific and causal modelling. Despite the development of cognitive instruments for the comprehension of future, the stochastic and chaotic nature of many natural and social processes has made precise forecasting of the future elusive. In art and culture[edit] Futurism[edit] Futurism as an art movement originated in Italy at the beginning of the 20th century. It developed largely in Italy and in Russia , although it also had adherents in other countries - in England and Portugal for example. The Futurists explored every medium of art, including painting , sculpture , poetry , theatre , music , architecture , and even gastronomy. Futurists had a passionate loathing of ideas from the past, especially political and artistic traditions. They also espoused a love of speed , technology , and violence. The car, the plane, and the industrial town were all legendary for the Futurists, because they represented the technological triumph of people over nature. The Futurist Manifesto of declared: Closely identified with the central Italian

Futurist movement were brother composers Luigi Russolo and Antonio Russolo , who used instruments known as intonarumori - essentially sound boxes used to create music out of noise. Literary futurism made its debut with F. Futurist poetry used unexpected combinations of images and hyper-conciseness not to be confused with the actual length of the poem. Futurist theater works have scenes a few sentences long, use nonsensical humor, and try to discredit the deep-rooted dramatic traditions with parody. Longer literature forms, such as novels, had no place in the Futurist aesthetic, which had an obsession with speed and compression. Futurism expanded to encompass other artistic domains and ultimately included painting, sculpture, ceramics, graphic design , industrial design, interior design, theatre design, textiles, drama, literature, music and architecture. In architecture, it featured a distinctive thrust towards rationalism and modernism through the use of advanced building materials. The ideals of futurism remain as significant components of modern Western culture ; the emphasis on youth, speed, power and technology finding expression in much of modern commercial cinema and commercial culture. Futurism has produced several reactions, including the s-era literary genre of cyberpunk â€” which often treated technology with a critical eye. Science fiction[edit] Print c. Science fiction is found in books, art, television, films, games, theater, and other media. Science fiction differs from fantasy in that, within the context of the story, its imaginary elements are largely possible within scientifically established or scientifically postulated laws of nature though some elements in a story might still be pure imaginative speculation. Settings may include the future, or alternative time-lines, and stories may depict new or speculative scientific principles such as time travel or psionics , or new technology such as nanotechnology , faster-than-light travel or robots. Exploring the consequences of such differences is the traditional purpose of science fiction, making it a "literature of ideas". Sometimes authors publish a timeline of events in their history, while other times the reader can reconstruct the order of the stories from information in the books. Some published works constitute "future history" in a more literal senseâ€”i. Wikiquote has quotations related to: Future Look up future in Wiktionary, the free dictionary.

Proximity Keys Transponder chip keys These types of keys use a transponder technology. The buttons you press sends a signal to the car to unlock or lock it. Key fobs These are also called electronic keys and they came after transponder keys. They have pressable buttons for locking and unlocking the car as well. With fob key systems, you can set your car to be on alarm mode such that when a bugler wants to break into it a siren will alert you. You may wonder what the deferent between this key and the transponder chip key is. High-security keys These keys are stepped up when it comes to security, meaning they cannot be easily duplicated. However, they are not as popular as the transponder chip and the fob key. Proximity keys As the name suggests the car senses this type of key when you are approaching then automatically unlock the doors for you. Some proximity keys may start the car but that depends on the technology used in both the vehicle and the key. This key type is not common but it is gaining popularity with new car models. You have two options to get replacement keys to your car. You can get them either from your dealer, or a local auto locksmith. With both of them, there are pros and cons that you may need to scan over while making the decision on whom to provide the spare keys. With your dealer, you are assured of quality in the replacement keys because they were the manufacturers of the car in the first place. However, you may have to wait for a while before the new keys arrive. If you go by auto locksmiths, they can get you replacement keys faster but it may not be easy to land on a good locksmith that will do a dealership level service, especially with the latest car models. My advice on this is that you ask people within your circle, a relative, friend or neighbor with the same car model with yours to know what works best in your area. So what is the future of car keys? With the rate of advancement that technology is taking us with in the motor industry, we can comfortably predict how car keys will be in some years to come. We expect an improved car key system that will use fingerprints. So, what prohibits a finger print car key system, yet so far, we are already using fob keys that are purely electronic gadgets? How is that possible? Only that specific person is allowed access to the room and that is by placing their hand on the availed platform. Alice is the founder behind the automotivebros. Hermann Rauschnig , who had just arrived in the United States. Vice President Henry A. Some of those plans are now out of date and have been partially or fully declassified. Operation Dropshot Main article: Operation Dropshot "Operation Dropshot" was the s United States contingency plan for a possible nuclear and conventional war with the Soviet Union in the Western European and Asian theaters. At the time the US nuclear arsenal was limited in size, based mostly in the United States, and depended on bombers for delivery. Between 75 and of the nuclear weapons were targeted to destroy Soviet combat aircraft on the ground. The scenario was devised prior to the development of intercontinental ballistic missiles. It was also devised before U. Nuclear weapons at this time were not accurate enough to hit a naval base without destroying the city adjacent to it, so the aim in using them was to destroy the enemy industrial capacity in an effort to cripple their war economy. Eisenhower , US Army , on 2 April Exercise Mainbrace brought together ships and over 50, personnel to practice the defence of Denmark and Norway from Russian attack in It was the first major NATO exercise. Ridgeway , US Army , during the autumn of Exercises Grand Slam and Longstep were naval exercises held in the Mediterranean Sea during to practice dislodging an enemy occupying force and amphibious assault. It involved over warships and aircraft under the overall command of Admiral Carney. The overall exercise commander, Admiral Carney summarized the accomplishments of Exercise Grand Slam by stating: As the largest peacetime naval operation up to that time, Operation Strikeback was characterized by military analyst Hanson W. While troops could easily fly across the Atlantic, the heavy equipment and armor reinforcements would have to come by sea. This section does not cite any sources. Please help improve this section by adding citations to reliable sources. Unsourced material may be challenged and removed. The exercise was intended to ensure that NATO had the ability to quickly deploy forces to West Germany in the event of a conflict with the Warsaw Pact. Therefore, in the event of a Soviet invasion, in order not to resort to tactical nuclear strikes, NATO forces holding the line against a Warsaw Pact armored spearhead would have to be quickly resupplied and replaced. Most of this support would have come across the Atlantic from the US and Canada. Reforger was not merely a show of force—”in the event of a conflict, it would be the actual plan to strengthen the NATO presence in Europe. In that instance, it would have been referred to as Operation Reforger. Seven Days to the River Rhine Main article: Seven Days to the River Rhine was a top secret military simulation exercise developed in by the Warsaw Pact. It started with the assumption that NATO would launch a nuclear attack on the Vistula river valley in a first-strike scenario, which would result in as many as two million Polish civilian casualties. Individual Warsaw Pact states were only assigned their own subpart of the strategic picture; in this case, the Polish forces were only expected to go as far as Germany. The Seven Days to the Rhine plan envisioned that Poland and Germany would be largely destroyed by nuclear exchanges, and that large numbers of troops would die of radiation sickness. It was estimated that NATO would fire nuclear weapons behind the advancing Soviet lines to cut off their supply lines and thus blunt their advance. Newspapers speculated when this plan was declassified, that France and the UK were not to be hit in an effort to get them to withhold use of their own nuclear weapons. Exercise Able Archer Main article: Exercise Able Archer was an annual exercise by the United States military in Europe that practiced command and control procedures, with emphasis on transition from solely conventional operations to chemical, nuclear, and conventional operations during a time of war. Able Archer exercises simulated a period of conflict escalation , culminating in a coordinated nuclear attack. President Ronald Reagan on 23 March Although he later believed in disarmament treaties slowly blunting the danger of nuclear weaponry by reducing their number and alert status, he also believed a technological solution might allow incoming ICBMs to be shot down, thus making the US invulnerable to a first strike. However the USSR saw the SDI concept as a major threat, since unilateral deployment of the system would allow the US to launch a massive first strike on the

Soviet Union without any fear of retaliation. The SDI concept was to use ground-based and space-based systems to protect the United States from attack by strategic nuclear ballistic missiles. The initiative focused on strategic defense rather than the prior strategic offense doctrine of Mutual Assured Destruction MAD. NATO nuclear sharing Main article: In peace time , the nuclear weapons stored in non-nuclear countries are guarded by US airmen though previously some artillery and missile systems were guarded by US Army soldiers; the codes required for detonating them are under American control. The delivery warplanes used are Fs and Panavia Tornados. Please update this article to reflect recent events or newly available information.
