

1: Update roadmap - Secret World Legends

Roadmap to the Zone will be an invaluable tool for anyone who has the desire to consistently perform at a high level, and is serious about achieving the goals they set. Read more One person found this helpful.

Identify processes, deploy bots and scale effortlessly with AssistEdge. This article is a continuation of Part 1. You can find the first part here. Implement Existing Analytics Workflows It is likely that when you begin your AIOps journey, you will already have certain analytics in place. I mean offline, mostly manual analytics, that you do regularly, irregularly, or periodically to identify areas for process improvement, reduce costs, improve performance, etc. These manual efforts are precisely what your AIOps solution should address and automate in its first iteration. Once the data you use to do these investigations is flowing into your data platform, you should seek to recreate and automate the analyses. Remember that AIOps is intended to put you into a position of doing real-time analysis on data sets beyond human scale. Begin Implementation of Automation Ah, automation. Everyone knows its value. Everyone knows they need it or at least could use it. Few organizations put it into practice. Fewer still approach it as a practice with discipline. There used to be a mantra in performance management – "Monitor all the things! To address this, you need to turn to machines to perform analysis and execute automation. There are, however, other process factors that impact the desperate need for IT operations to automate. Task automation in IT Operations typically has been and remains segregated by tools. Your service desk has some automation, you have automated patching for your servers, and you may automate some remediations from your monitoring tools. Orchestration across these tools is more difficult to achieve and rarely fully accomplished. DevOps is essentially the automation of development tasks and their orchestration – to eliminate the bottlenecks caused by phased review processes in waterfall developments, segregated test and compliance activities and operational, pre-production interlocks. What this means for IT is that DevOps application teams creating the innovative cloud services impacting the business are now moving at lightning speed compared to the traditional application teams of the past. That is the situation that modern IT Ops finds itself in. This begins by automating and orchestrating the things they already do – across siloed tools – and finding ways to connect, share information, and communicate with the DevOps teams in their enterprises. Develop New Analytics Workflows Above, I talked about implementing existing, manual analytics workflows into your AIOps solution to automate and scale them. Once this is accomplished, you should have the bandwidth to: Assess the value of those workflows Modify and improve those workflows Develop new workflows based on the existing or to address gaps Part of the problem with the "brute-force spreadsheet" approach to doing analysis with disparate data sets is that the energy and focus it requires oftentimes exhausts the capacity for the practitioner to assess the value of what is being delivered. Reports have been promised, meetings are scheduled, and expectations have been set. Unless a leader calls for a re-evaluation of the approach, rarely is the process questioned. Once the existing process has been automated in the AIOps platform, the practitioner can step back and evaluate whether the necessary information is being analyzed, insights are being gained and results are actionable. You will transition out of the need to have someone who has domain knowledge for the purposes of tactically addressing issues to one who can put that knowledge to use training the system. IT Ops will move from a "practitioner" to an "auditor" role. It does require understanding how systems are processing data and whether the desired business outcomes are being achieved. IT Operations has long had a bunker, hero mentality, particularly with monitoring teams. Giving up control to a machine will be one of the most difficult transitions those who have been steeped in the practice for decades will experience. This is an inevitable result of market trends as they exist now. The move to business beyond human scale will have significant consequences for the humans who have been used to managing it. Organizations will have to cultivate this new skill in their existing – reduced – workforce or bring in talent that either has the skill or can adapt to the change. This will be challenging in two ways: Customize Analytic Techniques The last activity I will discuss is both the most speculative and the most contentious. It is the question of whether IT Operations organizations will need to develop a mature data science practice or not. Some analysts believe you do. I believe in the segregation between domain and data

science knowledge. I have two preceding paradigms in mind: Scientists have long been executing complex, data-intensive analyses. With the rise of machine computation, scientists had to develop, at least, the ability to craft the mathematical algorithms that they wanted to run on their data sets. At first, when computational resources were shared, scientists built their own analyses to be run on systems maintained by computer experts. In that paradigm, scientists developed specialized knowledge that allowed them to leverage the computational systems. They were able to do this because: They were afforded the time in an academic setting to acquire the skills and knowledge necessary Failure to do so would be fatal to their careers â€” labor competition Let us contrast this with the programmer-analyst. In spite of the ubiquity of data science jobs and data science education both formal and informal , the market is bereft of people who have M. This may change, but I do not foresee that happening soon, if ever. It is simply the case that it is too hard for most people to learn the math required and too easy to make very good money with just the coding to incent them take on more than that. And even if they did, they would still need the domain knowledge required for a particular industry or problem area. Asking IT Operations practitioners to know math, IT, and coding to manage infrastructure, applications and services is, I think, too much. In this paradigm, AIOps vendors provide systems that offer multiple analytics options from which practitioners select combinations that best fit their environments. Also ideally, the AIOps platforms would provide regression analysis that would suggest "best-fit" options from which practitioners could make informed decisions. This is how I see new and customized analytics coming out of AIOps. For revenue generating activities, this may make sense. Identify current use cases Agree on a system of record Determine success criteria and begin tracking them Assess current and future state data models Implement existing analytics workflows.

2: The Zone: A Dietary Road Map to Lose Weight Permanently by Barry Sears

Road Map to the Zone The Zone is a magical period of perfection. Those athletes who have experienced it say it's like finding an extra gear where they had uncharacteristic surges of speed and strength.

What Are Their Roles and Responsibilities? They act as a coach and keep a positive attitude to motivate their team as well as others. They also create an environment of enthusiasm and team spirit around what is being delivered. They need to understand the Agile Manifesto and the 12 Agile Principles in order to guide the team, be the voice of reason and authority, and make the tough calls. They build a rapport with their team as well as other colleagues throughout the organization to enhance team trust. They understand overall team progress and commitments and actively work to improve team accountability, collaboration, and productivity. They ensure the team delivers fully tested, working software that meets the business need. They are usually the ones ahead of the trending developments in Agile, understand them, and apply them to various projects. They identify and champion process or other departmental improvements in coordination with fellow Agile Facilitators or department members and lead the implementation. They work with the Product Owner to groom the backlog, ensuring that the PBIs contain acceptance criteria and are sized appropriately. They organize and facilitate sprint planning, daily stand-up meetings, story pointing sessions, release planning, and retrospectives.

Agile Coach The next level is that of the Agile Coach who operates at a multi-team level. Most people usually focus on becoming a great Agile Coach and forget that there is the next level to this. However, this is an absolutely legitimate place to make a stop – if there were more skilled Agile Coaches, Agile would be much healthier.

What Do They Do? Strategically focus across many teams. Have a perspective on Agile best practices. Solid experience with Agile program structure. Experienced establishing an Agile transformation approach. Limited experience with Agile outside of IT. Lastly, they identify metric, formulas, and collection mechanisms, as well as provide good examples of expected deliverables and daily reports. Enterprise Agile Coaches have credibility and knowledge, as well as deep coaching skills that will be used directly to coach the leadership team. Enterprise Agile Coaches most often have deep experience in Agile as well as organizational development, change, and culture and can work at all levels in an organization. They strategically focus across portfolios. They experience more than one Agile process. They have a perspective on mapping Agile frameworks to types of work. They utilize solid experience with multiple strategic topics, executive discussions on Agile, Agile program structure, and establishing an Agile transformation approach, as well as experience with Agile outside of IT Take Agile to the next level with DevOps. 3: ROADMAP “ EUNOMIA TOKEN

A road map to the green zone For the shipping industry to be carbon-neutral by , all stakeholders need to support the maritime energy transition. The story behind the world's first container ship to be converted to LNG offers insights into the challenges faced, opportunities offered and pioneering drive required.

Potential reductions in CO₂ The environment and expertise The second reason for adopting LNG was more of a personal motivation to protect the environment. Basically, the choice came down to continuing with marine diesel oil with the addition of a scrubber for exhaust gas cleaning, or switching to LNG. The former was rejected, as an open-loop system would result in discharging waste water containing sulfur into the sea. A retrofit on this scale is not a trivial matter and requires specialist know-how, parts and implementation. Which meant MAN was the preferred partner for the task. Driving the transition to LNG By scheduling the retrofit during a major planned engine overhaul, the costs would also be kept lower. The parts to be exchanged are essentially all wearing parts that will have reached the end of their effective lives, and would have been scheduled for replacement anyway, by MAN PrimeServ, the after-sales division of MAN Energy Solutions. The pioneering drive When MAN took on this retrofit, it was more than a technologically pioneering feat. The similarity is clear. Just as the technology for renewable energy generation was available, the technology necessary to use LNG as a fuel on a large scale was also there and ready. But to untie the knot that clogged the system, politics had to jump on board, too. In the long term, it will require ways to generate LNG from renewable resources. Essential for all of this is the setting of global standards. However, this does not mean that local governments should be idle: From a mere economic standpoint, the case for the retrofit was a tough one to argue. The solution would require an element of political commitment, too. It was the pioneering but fully replicable character of the project that convinced the German government to get involved. The multiplier effect The Wes Amelie has 23 sister ships, and 16 of them are structurally identical, which guarantees that similar projects could be easily implemented in the future. The scalability of the engineering services and the development costs would significantly reduce the costs for all follow-up projects. Once the BMVI recognized the contribution such a project could make to the industry in the long term, additional funding was awarded. This would also enable a short, three-year amortization of the investment. Hoepfner is convinced that it was this interplay of political support, tough regulations, advanced engineering and the right attitude to environmental protection that sealed the eco-friendly deal for the retrofit: Next to advanced engineering and personal conviction, pushing through with this will take better regulation and the political will to succeed.

Roadmap to the Zone. A Step-by-Step Guide to Achieving Your Highest Athletic Dreams. We can't be everyone's Mental Trainer®, so we wrote an e-book as the next best thing.

In addition, from 2020, the global marine sulfur emission limits will be cut from 3.5 to 0.5. For the shipping industry to be carbon-neutral by 2050, all stakeholders need to support the maritime energy transition. Surrounded by nine countries – Sweden and Finland to the north, Russia, Estonia, Latvia and Lithuania to the east, with Poland to the south, and Germany and Denmark to the west – the region serves as an environmental benchmark for the shipping industry, which has only been achieved by collaborating and adopting more than the minimum international standards. Instead of kicking the can down the road, the region has signed up to a cleaner road map for the future of shipping. Owned by the German shipping company Wessels Reederei, the vessel will be retrofitted to dual-fuel operation. The motivation for the retrofit came from a number of directions. What they found out: The numbers were convincing. Basically, the choice came down to continuing with marine diesel oil with the addition of a scrubber for exhaust gas cleaning, or switching to LNG. The former was rejected, as an open-loop system would result in discharging waste water containing sulfur into the sea. A retrofit on this scale is not a trivial matter and requires specialist know-how, parts and implementation. Which meant MAN was the preferred partner for the task. Driving the transition to LNG By scheduling the retrofit during a major planned engine overhaul, the costs would also be kept lower. The similarity is clear. Just as the technology for renewable energy generation was available, the technology necessary to use LNG as a fuel on a large scale was also there and ready. But to untie the knot that clogged the system, politics had to jump on board, too. In the long term, it will require ways to generate LNG from renewable resources. 5: www.enganchecubano.com: Customer reviews: Roadmap to the Zone: enhancing athletic performance

Imagine you had your own sport psychologist to design a mental skills training program just for you. and perform your best? What if it prepared you for the tough times by giving you tools to overcome adversity?

Try out those new challenges with a group of five players, comprised of a tank, healer and damage classes. Choose one of the 10 levels of difficulty, and reap the rewards accordingly. Including deep intrigue and high-speed snowmobile chases throughout the Carpathian Fangs, you will meet new characters and experience first-hand a chain of events with massive repercussions on the world. You must find a way to turn the tide back and protect Agartha from the Filth and its guardians. Only once the battle has been won will you be able to enter Tokyo in search of answers. Battle against never seen before enemies as you take on this new chapter of the main story mission. In this huge district, plagued by ghosts, demonic Oni mercenaries, corrupted Orochi cyborgs, and hundreds of Filth infected citizens, many mysteries await. In there you will perform occult rituals to summon powerful bosses. With this update, you will be able to partake in the final, biggest rituals directly performed in Agartha, where you will summon massive bosses that can be defeated with up to 40 players and earn powerful Signet rewards. You might have already caught a glimpse of that dangerous enemy in a dream as you came to grip with your newly found power. Now is the time to fight and defeat this monster for real. Make your way through office blocks as terrified citizens run for their lives, and get ready to take a stand as you face the monster in Times Square itself. Just like Elite Dungeons, Raids will come in varied difficulties and will earn you powerful rewards. Take on new challenges and come face to face with John, the man that set off the device that exploded in Tokyo, unleashing the rising tide of Darkness across the world and incidentally led you to receiving your powers. Experience the conclusion of this massive chapter in the main story line. Reap the consequences of your choices in the main story and gain the ultimate reward! This update also includes a brand-new Lair to the region with never-before-seen monsters and rewards. This is your chance to get your hands on some awesome Halloween costumes and plenty more rewards! Look forward to cool new content and outfits. Push forward against dangerous enemies and collect great rewards. As a results of the events that ended at the top of the Orochi Tower, continue the main story mission and follow up on a lead which will send you on your way to a brand new country.
