*Security, Audit and Control Features SAP R/3: A Technical and Risk Management Reference Guide - Table of Contents.*

When using a distributed system, you need to be sure that your data and processes support your business needs without allowing unauthorized access to critical information. User errors, carelessness, or attempted to manipulate on your system should not result in loss of information or time of processing. The company was founded in by the five former IBM employees. The integration results in consistency of data through out the system and the company as a whole. Internet communication Manager ICM -set up connection to internet. Dispatcher distributes the requests to the work processes. If all the processes are occupied then the requests are stored in dispatcher queue. Message server exchanges the messages and balances the load. However, to effectively use services provided by SAP, you need to make your own contribution as well. You need to determine which security demands apply specifically to your system. SAP encourage you to carefully analyze your requirements on system security and define priorities. Where are you most vulnerable? What information do you consider critical? Where is critical information stored or transferred? What security options are available to protect your critical data and communications? When establishing your security policy, you need to decide what information or processes you consider critical. You need to decide what type of protection you need for this information. Your security policy should encompass aspects such as: It is important to only allow legitimate users access to your system and prevent users from being impersonated! It is important that users can only perform tasks for which they are authorized! It is important that data cannot be changed without detection! It is important to protect data or communications from unauthorized viewing or eavesdropping! It is important to be able to ensure liability and legal obligation! It is important to record activities and events for future references for example, audits! You need to know that the users who operate within your system are known users and that they cannot be impersonated. For example, you can force users to regularly change their passwords, or you can prohibit certain words or character combinations. Authorization It is important that users can only perform those tasks for which they are authorized. A typical company has various roles in its organization, and the personnel who fill these roles perform certain tasks. Data and processes should not be accessible by roles where they are not needed. For example, a worker in the personnel department needs access to payroll processes and employee data. This information should not be accessible to workers in other departments such as manufacturing or sales. Users can only use those transactions and programs that they are explicitly allowed to access. The Profile Generator provides a top-down approach to assigning authorizations and the Authorization Info system provides you with an easily accessible overview about your authorizations and their assignments. Integrity You need to protect the information that you process on a daily basis from unauthorized changes, either through error or deliberate acts. If a user processes a transaction for example, makes a payment on an account , he or she needs to be sure that the information remains consistent throughout processing. When a user accesses data, he or she needs to be sure that it is the data that was last saved. The hardware and software must operate according to expectations, without executing undefined or unwanted actions. This process must function so well that the system as a whole can function without problems or without corrupting the data. The presentation software performs an integrity check on itself to make sure that it does not contain viruses. Digital signatures are available with the Secure Store and Forward SSF mechanisms and are used by certain applications. Privacy It has always been necessary to protect sensitive and private information from viewing by unauthorized parties. Employers are obligated to keep contracts and employee information secret. Data protection laws prohibit distributing personal information. Company and customer information, or product and prototype information are kept in a company safe. This protection also applies to data that is saved on or communicated over electronic media. A message is considered obligatory if you can guarantee who the creator of the message is, as well as the correctness of the message. For example, before closing an electronic paperless contract, you want to be sure that the contract is obligatory and proof-worthy. Therefore, it must be possible to prove the authenticity of the sender of the document, as well as the actuality of its contents. In these application areas, handwritten signatures are replaced with digital

signatures, automating the work processes while maintaining one-to-one identification of the signer at the time of signing. The following are examples of applications that currently use SSF to produce digital signatures: Quality Management Production Planning for Process Industries Auditing and Logging It is also important to record events and activities for future reference. It is not only necessary to save certain information for legal purposes, logs and audits can also prove to be critical in monitoring the security of your system and tracking events in case of problems. Additional logs include the system log, statistic records in CCMS Computing Center Management System , change documents for business objects, and application logging.
