Your shortcut to better photographs. As a photographer you shoot in Raw or Jpeg, or sometimes both. You may start in Lightroom or Adobe Camera Raw, but many photographers will end up in Photoshop doing more detailed editing of your photographs. Now it is time to save. What do you do? It is meant to focus on how you save to share photos on the web and for print. Here are a few of the most common formats and why you may or may not want to use them: Saving this way will retain adjustment layers, your masks, shapes, clipping paths, layer styles, blending modes. Useful if you need to maintain transparency. PSDs often are large in size, especially if you edit with many layers. Only those with Photoshop, Adobe products or certain other graphics programs will be able to view them. Unless you are printing from an Adobe application like Photoshop, or possibly another graphics program, you will need to save in a different format for printing, such as at a professional lab. You cannot display on the web in this format. TIFF This targeted file format is the highest quality and is excellent for print as there is no loss in quality. Retains information in layers, depending how you save it. The downsides are the extremely large file size and you cannot display on the web in this format. Lossless format so you will retain information from your images as you re-open and re-save. It is viewable by all and can be used for print and the web. When saving as a jpg, you decide what quality you desire In Photoshop for example a level 1 is the lowest quality or a 12 which is the highest quality The biggest downsize is that the jpeg format is lossy. Each time you open and save, the image compresses and you lose a small amount of information. Another downside is that layers are flattened upon saving so you lose the ability to go back to past edits to tweak. Often used for graphics instead of GIF. You can share these files on the web. The file size is very small so these files load fast on the web. The downsides are limited colors and does not handle photographs well. Hopefully after reading this you have a better idea on which suits your style. There is no right or wrong per say, though many will feel strongly about how they manage their workflow. I personally simplify my workflow. While there is a compression and loss of information editing jpeg images, the difference is so minor unless you are re-opening dozens of times. For that reason, I save my images as PSD if I know I will need to come back to it to alter adjustment layers, masks, or layer opacity. Tell us which file formats you chose to save in and why? Add your comments below, and also vote in the poll shown here. Jodi Friedman, owner of MCP Actions , offers original Photoshop Actions and Workshops to customers internationally, which enable photographers, at the click of a button, to enhance and enrich their photos in a fast and efficient way.

Automatically Save Recovery Information Photoshop automatically stores crash-recovery information at the interval that you specify. If you experience a crash, Photoshop recovers your work when you restart it. Icon Uses the preview as a file icon on the desktop. Macintosh Thumbnail Displays the preview in the Open dialog box. Windows Thumbnail Saves a preview that Windows systems can display. Save large documents Photoshop supports documents up to , pixels in either dimension and offers three file formats for saving documents with images having more than 30, pixels in either dimension. Keep in mind that most other applications, including versions of Photoshop earlier than Photoshop CS, cannot handle files larger than 2 GB or images exceeding 30, pixels in either dimension. Photoshop Raw Supports documents of any pixel dimension or file size, but does not support layers. Large documents saved in the Photoshop Raw format are flattened. Layers are named automatically as they are saved. You can set options to control the generation of names. In the Export Layers To Files dialog box, under Destination, click Browse to select a destination for the exported files. By default, the generated files are saved in the sample folder as the source file. Enter a name in the File Name Prefix text box to specify a common name for the files. Select the Visible Layers Only option if you want to export only those layers that have visibility enabled in the Layers panel. Choose a file format from the File Type menu. Set options as necessary. Select the Include ICC Profile option if you want the working space profile embedded in the exported file. This is important for color-managed workflows.
