Look for and express regularity in repeated reasoning. Inform the students that the opposite sides in each figure are equal. Allow the students to use their calculators. Students should be able to see that the yellow square in the middle is the actual perfect square because all four sides are equal. Address the class and state Depending on how much the students are struggling, I may or may not hint them by writing the property addressed in the previous lesson on the board: Write this example on the board: Ask student pairs to simplify the following two expressions. Write these on the board. Ask them to simplify this expression. Call on a volunteer to write their work on the board. Chances are that the student will rewrite this expression in one of two ways: Make sure at least three routes are on the board including the most efficient route using 16 and 3. Say to the class: Afterwards, call on a volunteer. It is very important to ask students to demonstrate that the other two routes on the board lead to the same answer. Ask students to continue simplifying these until completely simplified. Write the following on the board after this is done. A radical expression completely simplified when the value under the radical sign, radicand , has no perfect square factors other than 1. Walk around to see how students are working. Make sure students see that they can either simplify the square root of 20 first, or multiply the radicands and simplify afterwards.
