*Robert A. Woods: Settlements, neighbourhoods and associations. Robert Archey Woods played a pivotal role in the introduction and development of university and social settlements in the United States of America.*

The majority of people have some type of social media account. Facebook, Instagram and Twitter are the way everyday people interact with the world. One in four individuals across the world actively use social media, and that number is expected to rise rapidly. Although there is still a stigma attached to substance use disorders, medical science now recognizes addiction as a disease that impacts the brain. It affects people from all backgrounds and not simply an issue of being morally or ethically correct. This new understanding of addiction as a medical condition has helped many individuals step out of the shame that kept them from sharing their situation with others. While isolation can make addiction worse, connecting with others and creating a support system are important parts of recovery. But sharing too much personal information on social media can be dangerous. Considering the negative and positive outcomes of communicating on social media can help you or a loved one find balance. In many ways, social media acts like a virtual gathering of individuals from all walks of life. If someone has a subject that is highly personal or still traumatic, it may be better to limit the audience for these difficult subjects to personal conversations in trusted settings. Cyber-bullying is a chronic social media problem. A recent study found that up to 24 percent of adolescents had experienced bullying online. Social media can also promote and encourage the use of substances. This is especially difficult for individuals who are in early recovery or active addiction. Photos and posts of parties and jokes about substance use have been shown to gradually ease perceptions of these serious issues. This can be difficult for individuals who are struggling to stay clean and sober and may minimize its importance. Internet addiction often co-occurs with depression, anxiety and other addictions. Tweet This Social media can also become an addiction. In fact, recent brain imaging studies have shown that addiction to the internet results in the same brain changes associated with substance use disorders. And internet addiction often co-occurs with depression, anxiety and other addictions. Individuals committed to living life without addiction offer advice and assistance to one another. Rehab treatment reviews, treatment locators, published scientific research and meeting finders help those struggling reach out for help. Facebook, Instagram, Twitter and other social platforms help individuals in recovery to reach out and support other individuals who have similar experiences. The power of in-person connections, as well as support from experienced recovery professionals, licensed counselors and treatment programs cannot be over-emphasized. But social media can be useful in helping those who struggle learn to talk openly about their recovery journey. If you or someone you love has struggled with addiction, consider the following resources to help aid the recovery process: Social Media Support Groups.

*Leading social recovery One of the young leaders stepping up to be a champion of recovery in our community is Chantal Beaver. In addition to being Executive Director of The Hub Family Resource Centre and sitting on a number of boards, she is also Chair of the Social Recovery Task Force and the Early Years Coalition.*

It is important to differentiate the psychosocial framework, which is a distinctive practice model, from the psychosocial or person-situation perspective that informs social work practice generally. The psychosocial framework originated in the early history of the social work profession and evolved greatly over time in response to new theoretical and practice developments. It exerted a major influence on social work practice, particularly from the 1930s to the 1960s, when it was the dominant social casework approach, particularly on the East Coast. Its goals were to restore, maintain, and enhance the personal and social functioning of individuals through mobilizing strengths; supporting coping capacities; building self-esteem; modifying dysfunctional patterns of thinking, feeling, and relating to others; linking people to necessary resources; and alleviating environmental stressors. Although it originally incorporated Freudian and ego psychological concepts, it has always drawn on both psychological and social theories. As new practice models developed in the 1970s, the psychosocial framework waned in importance, but it later underwent a resurgence. It continued to occupy an important place among an expanded repertoire of approaches and contributed to the generation of some of the newer practice models, such as crisis intervention. In recent years there have been numerous extensions to the psychosocial framework, which continues to be used widely by social work practitioners, particularly those who consider themselves to be clinical social workers. It may be more accurate today to describe the psychosocial framework as a perspective that guides practice rather than as a discrete practice model. Nevertheless, it does rely on a core of theoretical concepts and practice principles. Introductory Works There are many excellent descriptions of the psychosocial framework that provide readers with an introductory overview of the approach. Turner is a detailed description of Florence H. Recent publications that discuss the psychosocial framework and include its more contemporary extensions are Goldstein an encyclopedia entry, and Woods and Robinson The most recent and up-to-date summary of the psychosocial framework is Turner In The encyclopedia of social work. Edited by Terry Mizrahi and Larry E. New York and Washington, DC: The psychosocial approach to casework practice. In Theories of social casework. Edited by Robert W. Roberts and Robert H. This chapter by Hollis is an early summary of the psychosocial model of practice that she put forth. In Social work treatment: Edited by Francis J. Edited by Albert R. Psychosocial theory and social work treatment.

Print In an era in which Hollywood is loaded with partisan left-wingers who use their personal platforms to bash the president of the United States and his administration on a regular basis, it can be refreshing to see one celebrity use his platform for good. That has been the case for actor James Woods this week. Woods has been using his official Twitter account to help people in need. Families of those who have lost people also used the hashtag and tweeted at Woods about their missing family members sometimes along with their contact information so that others could get in touch if they heard or discovered anything. He is in stage 4 cancer; she is mostly bedridden. I cannot reach him. Please tell me if he is seen anywhere. My previous tweet did not have a photo. Richard Wayne Wilson and Suzanne Wilson. He is in stage 4 cancer, she is mostly bedridden. Assume they evacuated, but have heard nothing from them all day. They are not tech savvy. If you see them, please let me know. These two ladies have yet to make contact with relatives. They are safe in Durham. Please reach out to me if you know who these women are. Your thousands of retweets of invaluable information literally saved lives. God bless you all. Tom Joyce is a freelance writer from the South Shore of Massachusetts. He covers sports, pop culture, and politics and has contributed to The Federalist, Newsday, and other outlets.

### 4: Social Learning Theory and Addiction

*PopZette James Woods Is Using Social Media to Help Wildfire Victims in California Outspoken conservative and 'Vampires' star is showing other celebs exactly how they should be using their platforms.*

Classical conditioning and operant conditioning describe how we learn from direct experience. However, humans usually learn by observing others. This is called social learning. Social learning is the most common way that people learn. Therefore, it has important implications for recovery efforts. In this section, we limit our discussion to the learning that occurs within social groups. These groups may include the family, peers groups, and the larger community. We will further discuss the powerful influence of other social groups in another section. The social interactions that have the greatest influence are with the people who mattered to us as we grew up. This includes parents and other family members. It might also include a neighbor or teacher. Maybe we noticed our parents only ever relaxed and had fun when they gambled perhaps playing cards with friends. Maybe they coped with stress by smoking pot. Maybe we observed they never socialized unless they were drinking. If we observed these sorts of things then we will be more likely to try out these behaviors as well. This is because we have learned through observation that gambling, smoking pot, and drinking achieved a positive result. In the absence of other healthier examples, it would seem those activities were good ways to relax, have fun, and reduce stress. We can attribute this to social learning. People have a powerful need for social interaction. Therefore, it becomes important to consider the compelling social nature of many addictions. Many types of addiction require at least the cooperation of other people. Some types of addictions afford opportunities for pleasing social discourse and interaction as well. For example, heroin addicts often help one another obtain and use the drug. Alcohol is a frequent and often central feature of many social venues. Gambling casinos strive to provide an exciting social atmosphere. As addiction progresses, there are fewer opportunities for the addicted person to interact with healthy, non-addicted persons. This is because friends and family eventually disengage from the addict. It is nearly impossible to free yourself from an addiction without forming new relationships with healthier people, while disengaging from people who are not. This is one of the reasons that support groups are helpful in addiction recovery. These groups such as AA immediately provide a source of social support. Support groups promoting moderation or abstinence date back at least to the s White, Time spent with others in recovery reduces the amount of peer pressure to engage in addiction. From a social learning perspective, support groups offer opportunities to observe and interact with healthier people. When we apply social learning theory to addictions treatment, the usual treatment goals include: These refusal skills are very important because recovering people cannot altogether eliminate contact with their former addicted friends. This is particularly true during the early stages of recovery.

*Social learning is the most common way that people learn. Therefore, it has important implications for recovery efforts. In this section, we limit our discussion to the learning that occurs within social groups.*

This communication system sends information through a vast network of interconnecting neurons. Overtime, the brain develops a preferred or standard pathway to send signals between neurons neural pathways. However, because of new scientific developments we now know the brain is much more dynamic than we thought. The human brain continues to create new neurons and form neural pathways throughout our entire lifespan. Thus, neurons are dynamic cells that are constantly adapting to changing circumstances. This ability is known as neuronal plasticity. Scientists found that neuroplasticity regulates learning processes and helps us to adapt to our surroundings. As early as , the neuroscientist Donald Hebb claimed that neurons that frequently fire together form stronger linkages. In other words, "neurons that fire together, wire together. To better understand neuroplasticity, an analogy may be helpful. The more we travel a path, the faster, easier, and more familiar that path becomes. As we travel it more and more, it becomes wider, smoother, and easier to travel. It becomes a preferred route. The same is true of neural pathways. Overtime, the brain forms familiar neural pathways these become habitual routes. If a familiar route is blocked, the brain eventually forges a new route. Suppose you walk through the woods each day to visit a friend. You use the same trail each time. One day, as you travel along your familiar path, you discover a huge tree has fallen over. You will need to forge a new path to go around the tree. At first, this new path will be narrow, difficult, and slow. It might even be uncomfortable. Overtime, it will become a well-worn, comfortable path. It will be just as easy as the original path. New neural pathways are formed as addiction develops. When you take that drug away, the brain must again form new neural pathways. Just as when we had to forge a new trail in the woods, this is initially uncomfortable. Neuroplasticity explains why the initial period of recovery is difficult and uncomfortable. But we know from our hiking trail example, this difficulty is only temporary. This information is very helpful to know when attempting recovery. We can be successful if we persevere through this brief, uncomfortable period. Remember, it was difficult and uncomfortable to forge a new pathway around a fallen tree. The same is true for the initial period of recovery. It can be difficult and uncomfortable while these new neural pathways are forming. As long as the recovering person does not give up during this initial period of discomfort, new neural pathways will form that support recovery. These new pathways will become more established and better developed over time. As they do, recovery becomes easier and more comfortable. We have emphasized the adaptive, dynamic qualities of our brains ensure our survival. The brain adapts to the strong effects of addictive drugs and activities. When it does, changes occur in the brain regions associated with reward , memory and emotion , decision-making , and stress regulation. These changes to our brain make the repeated use of addictive substances or activities very compelling. Therefore, although addiction leads to structural changes in the brain, we are capable of learning new coping skills. We discuss these structural changes in the next section.

### 6: Social Forestry – Forest Schools Education

*Recovery Marriage Encounter Mi is a privately held company in Hawthorn Woods, IL and is a Single Location business. Categorized under Social Service and Welfare Organizations. Our records show it was established in and incorporated in Illinois.*

Settlements, neighbourhoods and associations Robert A. Settlements, neighbourhoods and associations. Robert Archey Woods played a pivotal role in the introduction and development of university and social settlements in the United States of America. In this brief assessment we outline his contribution. He appears to have had a strongly Calvinist upbringing. His father, a successful, small businessman was an active figure in the local Presbyterian church, but died when Robert was While his academic studies may have left something to be desired he gained much from the discussions and debates that were part of the College life Woods Woods was not seeking ordination. He soon fell under the influence of William Jowett Tucker, whose approach to social economics was deeply critical of charity organization and traditional philanthropy. Woods was beginning to search for a philosophy that could combine both social and individual salvation see Carson Robert Woods became a key figure in the introduction and development of university and social settlements in the United States. Founder and Head of South End House and Secretary of the National Federation of Settlements from to just before his death he was both an important animator and organizer, and exponent of settlement work. Many of his important papers were published in as *The Neighborhood in Nation Building*. Woods University settlements: In this important piece, Woods reflects on the development of settlement work in the United States and argues for the fostering of association, co-operation and common welfare. Woods The recovery of the parish. Originally an address, this piece makes a strong argument for neighbourhood fellowship and association and looks to role that churches can, and should, play in their cultivation. Further reading and bibliography Carson, M. *Social thought and the American settlement movement*, Chicago: University of Chicago Press. Mina Carson weaves the history of the North American settlement movement with an exploration of the thinking and contribution of key actors like Robert A. Champion of democracy, Boston and New York: Written by his widow, this account of his life is not critical but does provide some detail about his activities. *Collection of key papers and addresses*. Houghton, Mifflin and Co. A national estimate, New York: How to cite this article:
