The FS packs a lot of new features into a body that is slightly larger than the FS, yet looks and feels nearly identical in practice. One of the best new features are three built-in Neutral Density ND filters, alleviating the need to spend money and time buying and mounting external filters. The mechanism that controls the ND filter setting is a bit fussy to get set just right, but it is still a marked improvement over external ND filters. The adjustable handgrip mounting point is more secure and an XLR port is closer to the front of the camera to make it easier to connect a mounted microphone. The button controls also now protrude slightly higher above the body surface for improved tactile feedback. The included mm F3. The bokeh this lens produces has a very soft and appealing nature, creating nearly perfect circles of color in the unfocused areas of the shot. While we found the rotation feature helpful, the placement of the LCD monitor on the top of the camera body can make it difficult to see when the camera is mounted high above you. A viewfinder accessory is also included that attaches directly to the LCD monitor and magnifies the screen and cuts out unwanted light for better visibility in bright light. Although the screen was easier to see outside with the viewfinder attached, we found this accessory made focusing more difficult due to the magnification of the LCD monitor, reducing its sharpness. Using the included peaking and zebra stripes settings are a must when working with a camera this sensitive to focus and light, and will help to get proper focus and exposure. There is an XLR port on the right side of the body near the mount point to make connecting your external mic more convenient, as well as a secondary XLR port near the back for a second audio source. This allows the use of heavy over-sampling to create images with impeccable detail and little to no aliasing along edges. Until this update becomes available, the HD-SDI port can also be used to capture p video with 8-bit 4: One of the most exciting new features in the FS is the super slow-motion mode that allows you to capture as many as fps in full HD p. The results are absolutely amazing to watch, and it is incredible how simply slowing a subject down this much makes something that is rather ordinary look truly extraordinary. The fps settings produced fantastic results without huge losses in detail, while the fps setting noticeably reduced the quality and clarity. Sony-FScamcorder-viewfinder-with-attachment Be aware that to capture footage at these shutter speeds you will need much more light than you would normally need to get a proper exposure. If light levels are low, the FS can add up to 30dB of gain to brighten the image, but using anything beyond 18dB will introduce quite a bit of noise. The trigger that captures slow-motion can be set to 4. This is great as it allows you to capture a snippet of time that has already occurred, especially handy if you are waiting to capture a rare event. When you look at everything you get with the FS, it is an amazing value compared to some of the competition. Its low light performance , slow-motion capture, and overall picture quality is stunning. With the FS, you can have everything you need now, plus the ability to shoot 4K in the future. Tech Specs Recording Media:

I have watched all the videos and texts and read the manual but new to photography on a technical level, has left me dumbfounded! We have not been told how to even know where or what that setting would be. So when I went to do my assignment I got out in the field to do my assignment and I froze! I went to do my shot log and had little idea on what info off the screen needed to go where. I have watched all the videos for this week and I have done and highlighted all the reading. I referred to my manual but not understanding what I was trying to adjust left me not knowing which adjustments to make. I was super frustrated and got lots of pictures of which 4 I am happy with. I am going to redo the assignment tomorrow morning. Any peers have tips on how to understand the fStop, shutter, etc? I have watched and read all material required. I have not read the entire manual, most of it. I do not have the technical understanding and have not been shown how to do any of this other than a quick, overview of buttons and features. Can anyone who has used this equipment help me understand what I am trying to do? Sony FS is a very nice video camera. It does not do photos. It has not been designed for photography. Sony, as well as several other manufacturers have a number of nice cameras for photos, and even hybrid cameras that can make both photos and video, such as the Sony A7 series, for example. Frustration is a choice. Here is a rundown of what to do Now you are in still mode. Once in Manual mode, you can select your desired shutter speed button 9 and ISO button 2. You can see the values on the bottom panel of the LCD display 3 To select your aperture, click the Iris button button D and use the ring above it B to adjust the setting. It does do still Right, I forgot about the Photo mode. So fair enough, literally speaking it can do stills, too. But my point was, using the FS as a stills camera is as practical as using a rod of sausage to hammer down a nail into a plank of wood. Doable within limits, perhaps, but not the most practical approach. Therefore it looks like your illustrated reply was a double whammy. I have been taking them for days. The button is by the hand rocker on the top of the unit. I am so grateful for this step by step how to use reply. It must have taken you time and I am so thankful you were willing to take your time!!! I have to use a closed pen to press it. It is design flaw for sure! We have been left to pretty much figure out the mechanics of the entire camera and how they balance out one another and what that is all going to mean when we stop taking photos and start taking video! I am so glad I found this website, it has literally stopped me from crying in frustration of failure.
