Note: many of the personal values listed above came from a list I received while working with The LeaderShape Institute. I use my core values to create my annual Integrity Reports. Writing these reports is a yearly ritual that forces me to think about how I am living out my core values in real life.

How Values Help You Values exist, whether you recognize them or not. Life can be much easier when you acknowledge your values and when you make plans and decisions that honor them. If you value family, but you have to work hour weeks in your job, will you feel internal stress and conflict? In these types of situations, understanding your values can really help. When you know your own values, you can use them to make decisions about how to live your life, and you can answer questions like these: What job should I pursue? Should I accept this promotion? Should I start my own business? Should I compromise, or be firm with my position? Should I follow tradition, or travel down a new path? Also, as you move through life, your values may change. For example, when you start your career, success measured by money and status might be a top priority. But after you have a family, work-life balance may be what you value more. As your definition of success changes, so do your personal values. This is why keeping in touch with your values is a lifelong exercise. You should continuously revisit this, especially if you start to feel unbalanced. As you go through the exercise below, bear in mind that values that were important in the past may not be relevant now. A good way of starting to do this is to look back on your life to identify when you felt really good, and really confident that you were making good choices. Identify the times when you were happiest. Find examples from both your career and personal life. This will ensure some balance in your answers. What were you doing? Were you with other people? What other factors contributed to your happiness? Identify the times when you were most proud. Use examples from your career and personal life. Why were you proud? Did other people share your pride? What other factors contributed to your feelings of pride? Finding This Article Useful? Identify the times when you were most fulfilled and satisfied. Again, use both work and personal examples. What need or desire was fulfilled? How and why did the experience give your life meaning? What other factors contributed to your feelings of fulfillment? Determine your top values, based on your experiences of happiness, pride, and fulfillment. Why is each experience truly important and memorable? Use the following list of common personal values to help you get started and aim for about 10 top values. As you work through, you may find that some of these naturally combine. For instance, if you value philanthropy, community, and generosity, you might say that service to others is one of your top values.

History[edit] Suanpan the number represented in the picture is 6,, Today, the base decimal system, which is likely motivated by counting with the ten fingers , is ubiquitous. Other bases have been used in the past, and some continue to be used today. For example, the Babylonian numeral system , credited as the first positional numeral system, was base , but it lacked a real 0 value. Zero was indicated by a space between sexagesimal numerals. Nor was it used at the end of a number. Only context could differentiate them. The polymath Archimedes ca. With counting rods or abacus to perform arithmetic operations, the writing of the starting, intermediate and final values of a calculation could easily be done with a simple additive system in each position or column. This approach required no memorization of tables as does positional notation and could produce practical results quickly. For four centuries from the 13th to the 16th there was strong disagreement between those who believed in adopting the positional system in writing numbers and those who wanted to stay with the additive-system-plus-abacus. Although electronic calculators have largely replaced the abacus, the latter continues to be used in Japan and other Asian countries. Other French pro-decimal effortsâ€”currency decimalisation and the metrication of weights and measuresâ€”spread widely out of France to almost the whole world. History of positional fractions[edit] Main article: Modern cheques require a natural language spelling of an amount, as well as the decimal amount itself, to prevent such fraud. Many of the advantages claimed for the metric system could be realized by any consistent positional notation. Dozenal advocates say dozenal has several advantages over decimal, although the switching cost appears to be high. This section does not cite any sources. March Learn how and when to remove this template message Base of the numeral system[edit] In mathematical numeral systems the base or radix is usually the number of unique digits , including zero, that a positional numeral system uses to represent numbers. For example, for the decimal system the radix is 10, because it uses the 10 digits from 0 through 9. When a number "hits" 9, the next number will not be another different symbol, but a "1" followed by a "0". In binary, the radix is 2, since after it hits "1", instead of "2" or another written symbol, it jumps straight to "10", followed by "11" and "". The highest symbol of a positional numeral system usually has the value one less than the value of the base of that numeral system. The standard positional numeral systems differ from one another only in the base they use. The base is an integer that is greater than 1 or less than negative 1 , since a radix of zero would not have any digits, and a radix of 1 would only have the zero digit. Negative bases are rarely used. In a system with a negative radix, numbers may have many different possible representations. In certain non-standard positional numeral systems , including bijective numeration , the definition of the base or the allowed digits deviates from the above. In base decimal positional notation, there are 10 decimal digits and the number

How to Self-Promote as an Entrepreneur - October 3, Entrepreneurs love talking about company culture. Strong core values can drive smart hiring practices, reduce turnover and absenteeism, increase productivity and quality of work, help guide decision-making, improve customer relationships, and boost employee morale. Passion for what you do and happiness in the workplace lead to more productive employees, fewer workplace problems, and a higher quality of work. Companies that have embraced passion as a core value include Zappos, Coca-Cola, and Rackspace. Building a culture that values continuous education means your employees will grow with your organization and deliver better results. Epic offers its employees extensive training and a personal professional development fund. Innovation is probably the value that will give your company the biggest competitive advantage. Google even has a secret lab devoted to moonshot ideas, such as self-driving cars and Google Glass. Chipotle has distinguished itself among its fast casual counterparts by providing comprehensive information about the origins of its ingredients. Southwest Airlines, Zappos, Whole Foods, and American Express each embrace customer service as one of their core values. When your company is doing something to benefit others, your employees feel good about working with you, and your customers feel good about buying your products. You have to work to embed them in your culture. Consider these tips for building your values: Gather the core values of your company leaders, founding team, or employees. Zappos, for example, sent an email to employees asking for the values they wanted to live by. You and your co-founder can determine together which values overlap so you can choose the ones that are most important to your company. Test your commitment to your values. Core values should affect everything from how you conduct meetings to how you communicate with customers. Refer to your values in times of turmoil. In times of crisis, refer back to your values to determine the best course of action. However, your values impact absolutely everything. When choosing values, think of the type of people you want on your team, the experience your company provides, and how you want to feel. Use these attributes to shape your values.

Start with values, not your idea "Values are timeless. They are the bedrock of a company and don't change even when everything else does."

A table of values is a graphic organizer or chart that helps you determine two or more points that can be used to create your graph. Why Use a Table of Values? In order to graph a line, you must have two points. For any given linear equation, there are an infinite number of solutions or points on that line. If you just find two of the solutions, then you can plot your two points and draw a line through. This will be the line that represents the equation. Every point on that line is a solution to the equation. In my table, I have 4 columns as described below: The first column is for the x coordinate. For this column, I can choose any number I wish. Try to choose numbers that can be graphed on your graph. The second column is for substituting x into the equation in order to solve for y. So, whatever value I chose for x, I will substitute back into the equation and solve to find the y value. The third column is for the y value. After substituting your x value into the equation, your answer is the y coordinate. The last column is for your ordered pair. Your ordered pair is the x value and the y value. This is the point on your graph. After substituting those values into the equation: Therefore, the ordered pairs that I found on my graph were: I plotted those points on my graph. I then used my ruler and drew a straight line through those points. If you had done this problem on your own, you may have found three different points using the table of values. We can also find other solutions for the equation just by reading the graph. I see that 3,7 is a point on the graph. If I substitute 3 for x into the equation, I will get 7 as my y coordinate. This line goes on forever, so there are infinite solutions to the equation. This becomes a little trickier in choosing x coordinates because we could end up with a fraction for the y coordinate. This then becomes a little more difficult to graph. So, the trick is to look at the denominator of the coefficient. You want to choose x coordinates that are either multiples of the denominator or 0. Then choose either the same value as the denominator or a multiple of the denominator. Remember, you also have a choice of positive or negative numbers! This will ensure that your y coordinate is an integer which is much easier to graph. If the coefficient is a fraction, choose 0 or a multiple of the denominator as your x coordinates! Ok, one more example: There are an infinite number of solutions for this graph, as the line goes on forever in both directions. Any point on this line is a solution to the equation. A Few Notes About Example 3 This example has a slightly different direction, but involves the same process. The problem asks for 3 solutions. Remember, that when you find ordered pairs in your table of values, these are actually solutions to the equation. There are other solutions, which are all of the other points on the line. Any point on the line would be a correct answer to this problem. Now you are going to learn about slope and y-intercepts to make graphing these equations much easier and quicker!

If I have the value list on a layout that uses the same table as the value list's relationship is starting from, it works fine. But if I put the value list on a different layout/table, the value list shows no values.

We are pleased to share this guest post from Suzanne Hammer, founder of Hammer and Associates, on the topic of starting a values conversation with your family. To see the original post, go [here](#). In other words, why you give matters just as much, if not more, than what you give. Yet, how many people have voiced their own values, less held a conversation with loved ones about the values they share? Values are the core principles that guide us as individuals, as a family, and as executives of a family office. Every action we take, whether consciously or not, comes from an underlying value—one we likely have learned and embodied through role models or hard-earned experience. Too often, an enthusiastic donor or family jumps to: When we are aligned with our values, we feel connected with the world around us, as if we are living life on purpose. Values inform our decisions; they strengthen us as families and communities, and they often form the basis of the legacy we leave. The trick is to stay committed to the process until you uncover the deep-seated values that hold the family together, regardless of age, personalities or varying interests. Perhaps your family most values inclusiveness, social justice, freedom—respect for elders, loyalty, faith—creativity, self-expression, individuality. Here are 10 questions to help you start the values conversation: You can answer these questions on your own, or bring them to your family meetings. What are some of the values that have guided and sustained me through life? Jot down freely whatever comes to mind. Where did these values come from? What family stories or role models have instilled my values and worldview? How do these values show up in my actions? In the way we relate to one another? About Family Giving—ask yourselves: Why does our family exist? What is the purpose of our wealth? What change would we like to see in the world? How would we like to be remembered? What are the most important values we share in common? These questions may seem simple, and yet they can evoke rich discussions—ones that may bring your philanthropic mission and goals into focus. And holding these important conversations now may help you and your family members stay inspired over time. Have you held a values conversation with your family? What did you learn about yourself, and about other family members? Drop me a line at Suzanne SuzanneHammer. Other families can learn from your experience — anonymously of course!
