

## 1: 7 Systems Administrator Interview Questions and Answers | [www.enganchecubano.com](http://www.enganchecubano.com)

*Top 20 System Administrator (Microsoft) Interview Questions and Answers All but first questions are in random orders with some positional relevance to make it easier to follow. Answers are specifically worded to make it as simple as possible to understand without losing meaning.*

People that are interviewed for office administrator jobs need to create an impression of themselves as being reliable and highly professional in the way they conduct themselves. Candidates should make an extra effort to arrive with time to spare, and to ensure that they are smartly dressed. Applicants should not be afraid to let their personalities shine through during the interview discussions. Read the 10 most common interview questions here. Always give the interviewers a firm handshake, and make eye contact with each member of the team. Candidates should have researched the role, the attached responsibilities, and thought about how their own experience is applicable to the position well in advance. Research into the company itself is also important, as employers will be looking for evidence of motivation and attention to detail from candidates. Our recruiters in the sales, marketing and customer services sectors outline their top interview prep tip in the video below: Information for office administration candidates Administrator positions tend to be incredibly varied, with the individuals acting as the backbone of the office, and keeping everyone else functioning as efficiently as possible. Tasks can range from anything from answering the phones, to meeting and greeting new clients, and placing orders for stationery. Read all about the different roles, salaries and duties of an administrator. Good administrators need to be proactive in spotting potential problems and acting quickly to solve them, as well as being reliable and resourceful. They will usually be the individuals that other employees interact with most frequently, so it is important that they are personable and likeable. Demonstrating a positive, can-do attitude in the interview should be a priority. Administrators are often the first contact points for clients so they need to ensure they have good communication skills. They often create the first impression that potential customers and clients have of an organisation. Possible administrator interview questions Most questions can be broken down into 4 different types: Experience, Preference; Skills; and General questions. Experience-based interview questions What experience do you have in administrator roles? Here is your chance to run through all of your experience. Be concise and if you have done multiple roles, mention something specific for each one. Show that you have a lot of experience and are flexible. How do you keep yourself organised when dealing with tasks and requests from multiple sources? The best way to stay organised is to keep a log of every request and each task completed so that nothing is accidentally left to go past a deadline. Mention any software that you use for this purpose. How do you cope with busy, stressful periods? Answer that by staying organised and keeping a strict diary you find that stress does not become a real issue. As soon as you identify a possible delay due to high work volumes you raise this with your manager to see if the work can either be reallocated or given priority. Give an example of a time you have delivered great customer service. Ideally, you have some real work experience that you can talk about. Talk in some detail about what you did and why it was great. If you have no direct work experience then talk about an event where you helped a friend to resolve a problem and that these skills can be used in administration and customer care work. What role do you think an administrator plays in the office dynamic? Say that an administrator plays an important role in ensuring that diaries are properly managed and that all outgoing correspondence is well written and all incoming correspondence is read and delivered to the relevant managers quickly. Are you able to use any relevant software packages? If you have experience, mention the packages you have used. If not, get some training in the most important packages before your interview. Ask your recruitment consultant what are the best packages to learn. How do you deal with authority? Say that you deal with authority as you deal with customers - with integrity, professionalism and politeness. How would you react if you felt you were being pushed too far at work? If pushed too far you would consider speaking to your manager about workloads and expectations and try to resolve the situation. Say that you enjoy the challenge of meeting deadlines and of working in a team environment. For what you like least, say that you do not like it when you see disorganised work and a poorly managed diary; you feel the need to help organise and manage

the workload. How do you feel about multitasking at work? Multitasking is a necessary part of an administration job, so say that you enjoy multitasking and the challenge of ensuring that multiple functions and jobs are completed accurately and on time is part of what motivates you in your work. Administrators sometimes provide the first impression a customer has of a business, so a positive and professional outlook is needed at all times. Do you enjoy meeting new people and interacting with customers? Meeting people and speaking to customers is often a vital part of being an administrator. Say that you enjoy talking to people and that interaction with other people is often what makes the work most interesting. Ideally, you will be able to touch type well, so say yes to this. Shorthand is a dying art and fewer people are learning how to do this well. If you have the opportunity to learn it, then do so, because some managers like their administrators to be able to take down shorthand. What are your communication skills like? Say that they are very good and that you can communicate well face-to-face, on the telephone and via the Internet on email. Tell us about a time in your professional career when you went out of your way to complete a task for someone else. Hopefully, you have some real experiences - but you may have forgotten them by now. Think back and try to recall a time that you may have helped somebody when they were under pressure or off sick. Are you good at solving problems? Not all administrators need to be excellent problem solvers so if you are not the best, be honest and say so. You could say that you are not good at solving problems but you understand the skills of your colleagues well and will always be able to persuade somebody to assist. Why do you want to work for us? What do you know about us specifically? What are your main motivations? Do you think technology has a role to play in this position? How will you keep ahead of the curve? What are your main strengths and weaknesses? Why are you perfectly suited to this role? Do you have any questions for us? By now you should be well prepped for your job interview. We wish you the best of luck in your job search.

## 2: Top 20 System Administrator Interview Questions and Answers (MS) Â» Science and Technology

*System Administrator tasks builds configure and trouble shoot software and hardware enhancements, application deployments and infrastructure upgrades So place yourself as Network and System Administrator, Administration Executive, Information Security Engineer by looking into Wisdom Jobs interview question and answers given.*

Systems Administrator Interview Questions 7 Systems Administrator Interview Questions and Answers Whether you are preparing to interview a candidate or applying for a job, review our list of top Systems Administrator interview questions and answers. Technical skills matter a lot in systems administrator jobs. Identifying the problem instead of just telling hardware techs something is wrong Ability to troubleshoot Curiosity to figure out the "why" "Assuming the web page is up, I would investigate what could be wrong with the monitor. It could be a system overload or flapping, among other issues. Identifying the problem helps me prevent it in the future. What would you do? It is important for systems administrators to be unafraid of failure and experimentation. In fact, it can be rare for a first attempt at fixing a problem to succeed, and your candidates should have logical strategies for coming up with solutions. I always make sure to have at least two other backup plans. I always dig to find out why a problem occurred. Otherwise, it is liable to happen again and hurt the business. I am also a great communicator, able to share my insight with anyone in jargon-free language. DC means domain controller, and your candidates should know what it is. Use of lingo or jargon A mention of lingering objects Knowledge of days "If you back up a DC seven months old, you could encounter lingering objects that lead to inconsistent data. Many systems administrator jobs require interaction with users and knowledge of remote techniques and ticketing systems. This question ensures that the candidate will be able to do the customer service you require. My clients often refer me to others and talk about how I quickly restore their functionality. Someone who needs a lot of team support might not fare well here. An actual example from previous work A tie-in to telecommuting or field work for even more insight How the example benefited the worker, client or another party "I was fortunate enough to have a mentor at my first systems administrator job. He taught me the importance of initiative and preventing problems. So, I make it a point to touch base with clients regularly. In one of these instances last year, a check-in led to a conversation where I was able to identify the early stages of a badly written application.

## 3: Top 50 Linux System Administrator Interview Questions

*Top Interview Questions for a System Administrator (Microsoft) Position: All of the questions below are very common and must be prepared for before facing any interview for a System-Server Administrator position.*

Windows Server is a series of server operating systems developed by Microsoft Corporation. In this, the file is saved as a normal text file with a filename. It maintains a read-only copy of the zone database on another DNS server. Also, it acts as a back-up server to the primary server by providing fault tolerance and load balancing. Stub Zone: To add the application using the Software Installer. Even if the group policy is changed or removed, the user preference will still persist in the registry. Primary function of the domain controller is to validate users to the networks, it also provides a catalog of Active Directory Objects. To configure the DHCP server, you can create a reservation for the device. To create a reservation, you must know the MAC hardware address of the device. To determine the MAC address for a network device, you can use the `ipconfig` or `nbtstat` command line utilities. To look up for the information from the server, e-mail and another program follows or uses the internet protocol. It is a set of files and folders that is stored on the local hard disk of each domain controller in a domain and are replicated by the FRS File Replication Service. These files contain group or user policy information. In computing, a process is an instance of a computer program that is executed sequentially by a computer system which can run several computer programs concurrently. A thread is a several executable program that work together as a single process. For instance, one thread might send an error message to the user; another might handle error signals while the third thread might be executing the original action. It is a strategy for building fault tolerance and increase the storage capacity. To resolve remote requests related to the domains names on your network, local DNS servers can provide record information to remote DNS servers. Yes, you can connect other vendors directory services with Microsoft version. Files that controls the AD structure are `ntds`.

## 4: System Administrator: Interview Questions and Answers for System Administrators

*Technical skills matter a lot in systems administrator jobs. Thus, many of your interview questions should deal with assessing candidates' hard skills, and this question covers several areas of required knowledge.*

The Super Scope gives the DHCP server the possibility to have leases to multiple clients on the same physical network. The leases come from multiple scopes. These types of networks are also named multinet. How can we switch the roles in an Active Directory? Switching or transferring roles in an Active Directory can be made with the use of Ntdsutil. What is the purpose of a Stub zone DNS? It also resolves names for DNS namespaces, thing required when names must be resolved from two different DNS namespaces. The Stub zone contains: What main file is used for Active Directory backup and how it is made? Active Directory backup is made using NTbackup utility. The backup is made once with the system state and they are restored also together because they depend on each other. The system state has different components like: Does a windows administrator have to be critical? Yes and I can explain how. In what way is forward lookup zone different from the reverse lookup zone in NDS? There is one difference between these two: As a system administrator can you make backup and recovery of data? This is a responsibility that any system administrator must have assume as a basic skill. Of course there are many types of backup that can be made but all must be known for a successful career. When the system starts an IP is assigned automatically. The DHCP server has port number 68, while the client has Can you ensure an updated system all the time and perform market research? Market research is the key to an up-to date work. Is it possible for a computer to be able to browse the internet without having a default gateway? Yes it is as long as we use a public IP address. The gateway is required as a router or firewall when using an intranet address. Are you familiar with monitoring? To do this we must open the DNS then we must select the abc. In how much time are the security changes applied on the domain controllers? Including policies for personal and public lockout, the changes apply immediately. What do you do if a an end user states that a file is gone? Files are deleted constantly by end users but the backup can restore them. Where is the storage place of the environmental settings and documents from the roaming profile? What are the classes that we can find in the Active Directory of Windows Server ? They are the only ones that can make Active Directory objects. When is a good time for creating a forest? Certain companies that have different bases require different trees and separate namespaces. And unique names sometimes give birth to different identities of DNS. Also companies are sometimes acquired and get under other influences but the continuity must be preserved for the names. Can you explain to us about you experience in the past regarding windows administration? I have ten years of experience in this field, I was passionate about computers since childhood and I installed many operating systems at home and inside organizations including these versions of windows: I also managed these systems and performed maintenance, I worked with different applications from the windows environment. In this situation the application has to be started in the compatibility mode with a previously windows operating system. This is made by right clicking the application icon and choosing another Windows from the compatibility menu. What is the meaning of Repadmin. This tool is used by administrators to see the replication topology from the perspective of every domain controller. The active Directory forest can also be supervised by Repadmin. What big differences exist between these two operating systems: Windows and Windows XP? It has all the advantages for server usage. Windows is a little more professional than XP, but they are both coming with different versions for every user taste. The Home version of XP comes with minimal features because the target clients are beginners. What are the things that make Unix different from Windows? The code loading runtime of Unix is different from the one that Windows has. We must become aware of how the system exactly works before we make a dynamically loading module. Unix has the shared objects with the. Unix has just one type of library file, with the. When the link is created for a shared object file the definition of the identifier may not be found, so the object code from the library will be included.

## 5: Windows System Admin Interview Questions : sysadmin

*The following sample interview for system administrators will give you a quick start to your job interview preparation. System administrators are responsible for the entire network of hardware and software that makes up an organization's computer system.*

Today, the job opportunities for Linux experts are more than ever. So, one needs to prepare adequately to ensure success in the Linux system administrator interview process. While a huge demand continues to exist, just like any other job in the technology world, SysAdmins have to go through a rigorous hiring process that consists of preparing a professional resume, technical exams, and interview questions. Out of these, cracking a job interview is often the most critical test. Apart from being calm and composed, being well-prepared for an interview is the best thing one can do in order to crack a Linux SysAdmin interview. What does nslookup do? How do you display the top most process utilizing CPU process? How to check all open ports on a Linux machine and block the unused ports? How is it different from UNIX? Explain the boot process of Unix System in details. How do you change the permissions? Explain SUDO in detail. What are its disadvantages? Describe the boot order of a Linux machine. Design a 3-tier web application. Sketch how you would route network traffic from the internet into a few subnets. How do you know about virtualization? Is it good to use? What are different levels of RAID and what level will you use for a web server and database server? List some latest developments in open source technologies. Have you ever contributed to an open source project? Systems engineer or a systems administrator? List some of the common unethical practices followed by a system professional. What is the common size for a swap partition under a Linux system? What does a nameless directory represent in a Linux system? How to list all files, including hidden ones, in a directory? How to add a new system user without login permissions? What happens when a hardlink is removed? What happens when a sysadmin executes this command: How do you determine the private and public IP addresses of a Linux system? How do you send a mail attachment using bash? Tell me something about the Linux distros used on servers. Explain the process to re-install Grub in Linux in the shortest manner. What is a zombie process? When do we prefer a script over a compiled program? What happens when you delete the source to a symlink? Explain the directory structure of Linux. Explain its structure and working. How would you send an automated email to people at Tell me about ZFS file system. How to change the default run level in a Linux system? How would you change the kernel parameters in Linux? State the differences between SSH and Telnet. How would you virtualize a physical Linux machine? Tell me about some quirky Linux commands. Do you know about TOR browser? How to trigger a forced system check the next time you boot your machine? What backup techniques do you prefer? Tell me something about SWAP partition. Explain Ping of Death attack. How do you sniff the contents of an IP packet? Which OSI layer is responsible for making sure that the packet reaches its correct destination?

## 6: Windows System Administrator Interview Question and Answer | Technet 2U

*System Administrator Interview Questions. System Administrators are responsible for the proper operation of the company's IT systems, including hardware, software and network.*

Shares Top 20 System Administrator Microsoft Interview Questions and Answers All but first questions are in random orders with some positional relevance to make it easier to follow. Answers are specifically worded to make it as simple as possible to understand without losing meaning. For Technical Questions or Comments please visit cobuman. Keep in mind, you can also prepare for interview questions and answers by watching a video based of these questions below. Can you tell me about yourself? To answer this question properly, provide any information about you that is related to System Administration position. Talk about any experience, education, or certifications. Do not speak of things that are not related, for example hobbies. For a detailed guide to this questions follow the link. Explain the role of Windows Server. Windows Server is an operating system that uses a centralized computer that provides specific functions, predetermined rules for users and computers connected to a network. What is Windows Domain? Windows Domain is a centralized location for user accounts, computers, printers and security features as part of database controlled by a domain controller. What is DNS and which port does it use? How many queries does DNS perform and which ones? DNS performs two types of queries; Iterative and Recursive. What is Active Directory? It can also enforce security policies and install software to computers connected to a domain. Active Directory database is located where? Using file name NTDS. What is a Linger Object? If an Object is deleted from Active Directory while Domain controller is offline it can create a lingering object. When object is deleted from Active Directory a Tomb Stone which is temporary is created which then has to be replicated by Domain Controller before it expires. How do you back up Active Directory? With server a command prompt is used to perform backup: Do you know what Garbage Collection is? Garbage Collection is a process designed to free space inside Active Directory. This is performed by default every 12 hours defrag. System Volume folder is a directory that houses a copy of domain files found on a local hard drive within Domain Controller. This data is shared for purpose of replication across domain; for example user logon scripts and Windows Group Policy. Stands for Redundant Array of Independent Disks and is used to provide data redundancy mirroring across multiple hard disks. For example RAID 1; two or more disks with identical data stored redundancy. RAID 0; two or more disks, data distributed evenly to improve performance no redundancy. Which commands would you use in CMD to test network connectivity? To test network connectivity ping and ipconfig commands are used. What does IntelliMirror do? As part of Windows Server OS, IntelliMirror provides assistance in managing user data, computer information, applications and settings. This is used by user Group Policy that defines business roles, group memberships and locations. For example, if a user moves to a different computer; the applications, settings, and stored files will follow. Explain what Group Policy is. This makes it easier to control and process large groups of users. Can you name different types of email servers and which ports do they use? You can have two types of email servers: What is the difference between a forest and a domain? A domain is a logic based group of computers, users and devices within Active Directory. A tree is a collection of domains; in case there are multiple trees formed a forest is created. Do you know what Virtual Machine is? Virtual Machine is an emulation version of Operating System. You can have multiple copies of Windows Server running on a single hardware platform. This is mostly done through 3rd party software. Why should we hire you? This is your last chance to impress potential employer. Talk about any other experience that you may have related to this job. Mention things any employer could ask from their associates; for example being dependable, hardworking, and being a team player. Friends, I know it can be hard to prepare for an interview and frankly nerve wrecking, but try to relax and answer all questions with confidence. It can be really hard to predict exact questions asked during an interview, so please study from many sources before taking up an interview, to maximize your chances in succeeding. Best of luck to you!

## 7: Top 22 Windows Server Interview Questions & Answers

*These interview questions are meant to test a system administrator's curiosity and depth of knowledge. Answers to Tough Interview Questions.*

What do Forests, Trees, and Domains mean? Forests, trees, and domains are the logical divisions in an Active Directory network. A domain is defined as a logical group of network objects computers, users, devices that share the same active directory database. A tree is a collection of one or more domains and domain trees in a contiguous namespace linked in a transitive trust hierarchy. At the top of the structure is the forest. A forest is a collection of trees that share a common global catalog, directory schema, logical structure, and directory configuration. The forest represents the security boundary within which users, computers, groups, and other objects are accessible. Why do we use DHCP? Dynamic Host Configuration Protocol assigns dynamic IP addresses to network devices allowing them to have a different IP address each time they are connected to the network. What are Lingering Objects? A lingering object is a deleted AD object that still remains on the restored domain controller in its local copy of Active Directory. They can occur when changes are made to directories after system backups are created. When restoring a backup file, Active Directory generally requires that the backup file be no more than days old. This can happen if, after the backup was made, the object was deleted on another DC more than days ago. How can we remove Lingering Objects? Why should you not restore a DC that was backed up 6 months ago? If you attempt to restore a backup that is expired, you may face problems due to lingering objects. How do you backup AD? Backing up Active Directory is essential to maintain the proper health of the AD database. We need to use the command line to backup Active Directory. When the backup process has finished you should get a message that the backup completed successfully. If it did not complete properly you will need to troubleshoot. The questions above are very tricky and important from the standpoint of clearing any interview for a System Administrator Microsoft position. If you find any difficulty in answering any questions, ask me below the Comments section. Tips for Preparing for an Interview Study: Before an interview, do a quick recap of relevant technologies. You must be aware of your strengths and weaknesses. One of the best ways to prove the technical skills mentioned in your resume is through certifications. This gives a new employer an easy way to understand your knowledge level. Update your LinkedIn profile regularly; make sure that your work experience, qualifications, and project details match your resume. This article is the output of my extensive research and work experience. With this article I hope to help candidates in preparing for an interview for a system administrator position in a Microsoft multi-user computing environment. You can join our Facebook group, <http://>

## 8: System Administrator Interview Questions and Answers

*Administrative Assistant Interview Questions and Answers* While preparing, it can be useful to review questions you might be asked, and give some thought to how to frame a response, highlighting specific experiences and successes from previous jobs.

Another popular element in Linux is its mascot, a penguin figure named Tux. Unix originally began as a propriety operating system from Bell Laboratories, which later on spawned into different commercial versions. On the other hand, Linux is free, open source and intended as a non-propriety operating system for the masses. It combines all the features from the original version of Bourne Shell, plus additional functions to make it easier and more convenient to use. It has since been adapted as the default shell for most systems running Linux. The Linux Kernel is a low-level systems software whose main role is to manage hardware resources for the user. It is also used to provide an interface for user-level interaction. LILO is a boot loader for Linux. It is used mainly to load the Linux operating system into main memory so that it can begin its operations. Swap space is a certain amount of space used by Linux to temporarily hold some programs that are running concurrently. This happens when RAM does not have enough memory to hold all programs that are executing. Open source allows you to distribute your software, including source codes freely to anyone who is interested. People would then be able to add features and even debug and correct errors that are in the source code. They can even make it run better and then redistribute these enhanced source code freely again. This eventually benefits everyone in the community. Just like any other typical operating system, Linux has all of these components: What makes Linux advantageous over other operating system is that every aspect comes with additional features and all codes for these are downloadable for free. In general, one desktop environment, like KDE or Gnome, is good enough to operate without issues. Some programs will work in one environment and not work on the other, so it could also be considered a factor in selecting which environment to use. BASH follows no such convention. This so-called Free software movement allows several advantages, such as the freedom to run programs for any purpose and freedom to study and modify a program to your needs. It also allows you to redistribute copies of software to other people, as well as the freedom to improve software and have it released for the public. The root account is like a systems administrator account and allows you full control of the system. Here you can create and maintain user accounts, assigning different permissions for each account. It is the default account every time you install Linux. This interface allows the user to type declarative commands to instruct the computer to perform operations. CLI offers greater flexibility. However, other users who are already accustomed to using GUI find it difficult to remember commands including attributes that come with it. GUI, or Graphical User Interface, make use of images and icons that users click and manipulate as a way of communicating with the computer. Instead of having to remember and type commands, the use of graphical elements makes it easier to interact with the system, as well as adding more attraction through images, icons, and colors. To open the default shell which is where the command prompt can be found, press Ctrl-Alt-F1. This will provide a command line interface CLI from which you can run commands as needed. From a command shell, use the "concatenate" command: You should see a line starting something like Mem: This is the total memory Linux thinks it has available to use. You can also use commands free - m vmstat top htop to find current memory usage 17 What is a typical size for a swap partition under a Linux system? The preferred size for a swap partition is twice the amount of physical memory available on the system. If this is not possible, then the minimum size should be the same as the amount of memory installed. Symbolic links act similarly to shortcuts in Windows. Such links point to programs, files or directories. It also allows you instant access to it without having to go directly to the entire pathname. Just like Windows, you can use this key combination to perform a system restart. In Linux, each drive and device have different designations. Assuming you are the system administrator or the owner of a file or directory, you can grant permission using the chmod command. TXT, which is assigned to groups and others. Linux assigns numbers at the end of the drive identifier. Hard links point directly to the physical file on disk, and not on the pathname. This means that if you rename or move the original file, the link will not break

since the link is for the file itself, not the path where the file is located. Any filename can have a maximum of characters. This limit does not include the path name, so therefore the entire pathname and filename could well exceed characters. In general, filenames that are preceded by a dot are hidden files. These files can be configuration files that hold important data or setup info. Setting these files as hidden makes it less likely to be accidentally deleted. This serves as an alternative to minimizing and maximizing different windows on the current desktop. Using virtual desktops can clear the desktop when you can open one or more programs. To share a program across different virtual desktops, in the upper left-hand corner of a program window look for an icon that looks like a pushpin. Pressing this button will "pin" that application in place, making it appear in all virtual desktops, in the same position onscreen. This empty directory name serves as the nameless base of the Linux file system. This serves as an attachment for all other directories, files, drives, and devices. The pwd command is short for print working directory command.

Forests, trees, and domains are the logical divisions in an Active Directory network. A domain is defined as a logical group of network objects computers, users, devices that share the same active directory database. A tree is a collection of one or more domains and domain trees in a contiguous namespace linked in a transitive trust hierarchy. At the top of the structure is the forest. A forest is a collection of trees that share a common global catalog, directory schema, logical structure, and directory configuration. The forest represents the security boundary within which users, computers, groups, and other objects are accessible. Why Do We Use Dhcp? Dynamic Host Configuration Protocol assigns dynamic IP addresses to network devices allowing them to have a different IP address each time they are connected to the network. What Are Lingered Objects? A lingering object is a deleted AD object that still remains on the restored domain controller in its local copy of Active Directory. They can occur when changes are made to directories after system backups are created. When restoring a backup file, Active Directory generally requires that the backup file be no more than days old. This can happen if, after the backup was made, the object was deleted on another DC more than days ago. If you attempt to restore a backup that is expired, you may face problems due to lingering objects. Backing up Active Directory is essential to maintain the proper health of the AD database. We need to use the command line to backup Active Directory. When the backup process has finished you should get a message that the backup completed successfully. If it did not complete properly you will need to troubleshoot. Installation and replacement are some of the most frequently performed operations with hardware. Sometimes a system administrator might need to rebuild a hardware component. Typical duties include engineering, support and maintenance, and research for the purpose of innovation and upgrading. System administrators are experts at handling hardware and software. They are quick with both their hands and their head. They can work alone, but they know when and how to communicate with others, whether to report problems, learn information needed to fix problems, or instruct employees regarding technical issues. Analytical thinking and problem solving is crucial to be able to analyze software or hardware malfunction. They are also necessary to be able to improve or upgrade systems so that they suit company needs. Assertiveness also plays a role because administrators have to make decisions. They decide on solutions, security measures, and things like system upgrades. Administrators are typically called in to offer technical support for teams working on a project. Support might mean technical troubleshooting or the development and explanation of technological strategy with regards to the project goals and means. NTFS is the current file system used by Windows. Short for Voice Over Internet Protocol, a category of hardware and software that enables people to use the Internet as the transmission medium for telephone calls by sending voice data in packets using IP rather than by traditional circuit transmissions.
