Assembler E was designed to run on an OS/ system with a minimum of 32 KB of main storage, with the assembler itself requiring 15 KB. [6]: p.2 Assembler F could run under either DOS/ or OS/ on a system with a 64 KB memory, with the assembler requiring 44 KB.

The first part is the mainframe JCL required to run the program. The second part is the assembler program. Micro Focus Mainframe Express version 2. Mainframe Assembler This program does not provide much information when it is executed on the mainframe. The real value to this program is when it is animated using the Assembler Option of Mainframe Express provided by Micro Focus. It is possible to watch the actual execution of each individual instruction and to immediately see the results. Standard Assembler coding guidelines are used. The labels in this example are the mnemonic opcode preceded by an "I ". The following member ASMA1. This document may be used to assist as a tutorial for new programmers or as a quick reference for experienced programmers. In the world of programming there are many ways to solve a problem. This document and the links to other documents are intended to provide a greater awareness of the Data Management and Application Processing alternatives. The documentation and software were developed and tested on systems that are configured for a SIMOTIME environment based on the hardware, operating systems, user requirements and security requirements. Therefore, adjustments may be needed to execute the jobs and programs when transferred to a system of a different architecture or configuration. We appreciate hearing from you. Software Agreement and Disclaimer Permission to use, copy, modify and distribute this software, documentation or training material for any purpose requires a fee to be paid to SimoTime Technologies. Once the fee is received by SimoTime the latest version of the software, documentation or training material will be delivered and a license will be granted for use within an enterprise, provided the SimoTime copyright notice appear on all copies of the software. The SimoTime name or Logo may not be used in any advertising or publicity pertaining to the use of the software without the written permission of SimoTime Technologies. SimoTime Technologies makes no warranty or representations about the suitability of the software, documentation or learning material for any purpose. It is provided "AS IS" without any expressed or implied warranty, including the implied warranties of merchantability, fitness for a particular purpose and non-infringement. SimoTime Technologies shall not be liable for any direct, indirect, special or consequential damages resulting from the loss of use, data or projects, whether in an action of contract or tort, arising out of or in connection with the use or performance of this software, documentation or training material. Downloads and Links This section includes links to documents with additional information that are beyond the scope and purpose of this document. The first group of documents may be available from a local system or via an internet connection, the second group of documents will require an internet connection. A SimoTime License is required for the items to be made available on a local system or server. Current Server or Internet Access The following links may be to the current server or to the Internet. The latest versions of the SimoTime Documents and Program Suites are available on the Internet and may be accessed using the icon. If a user has a SimoTime Enterprise License the Documents and Program Suites may be available on a local server and accessed using the icon. Explore the Assembler Connection for more examples of mainframe Assembler programming techniques and sample code. Explore an Extended List of Software Technologies that are available for review and evaluation. The software technologies or Z-Packs provide individual programming examples, documentation and test data files in a single package. The Z-Packs are usually in zip format to reduce the amount of time to download. Explore An Enterprise System Model that describes and demonstrates how Applications that were running on a Mainframe System and non-relational data that was located on the Mainframe System were copied and deployed in a Microsoft Windows environment with Micro Focus Enterprise Server. These tables are provided for individuals that need to better understand the bit structures and differences of the encoding formats. Internet Access Required The following links will require an internet connection.

Assembler instructions[edit] Assembler instructions, sometimes termed directives on other systems, are requests to the assembler to perform various operations during the code generation process. Macros and conditional assembly[edit] Basic assembler language did not support macros. Later assembler versions allowed the programmer to group instructions together into macros and add them to a library, which can then be invoked in other programs, usually with parameters, like the preprocessor facilities in C and related languages. That makes the macro facility of this assembler very powerful. While multiline macros in C are an exception, macro definitions in assembler can easily be hundreds of lines. Operating system macros[edit] Most programs will require services from the operating system , and the OS provides standard macros for requesting those services. These are analogous to Unix system calls. Unlike Unix system calls, macros are not standardized across operating systems though. Even something as simple as writing a "sequential file" is coded differently e. Because of saving registers and later restoring and returning, this small program is usable as a batch program invoked directly by the operating system Job control language JCL like this: The differences were mainly in the complexity of expressions allowed and in macro processing. It had no support for macro instructions or extended mnemonics such as BH in place of BC 2 to branch if condition code 2 indicates a high compare. It could assemble only a single control section and did not allow dummy sections structure definitions. It came in two versions: D assemblers offered nearly all the features of higher versions. It was replaced by High Level Assembler. Other changes included relaxing restrictions on expressions and macro processing. The Fujitsu BS series was also built as a workalike from the same resource as Univac, and is still in use in some parts of Europe. It is open source and available from [http:](http://) This assembler has a unique syntax that is incompatible with other assemblers for IBM architectures.
