Tables for converting one inch lumber and Quebec standard into board measure [microform] Item Preview.

Lumber Sizes Simple, easy to understand definitions for the sizing of lumber. Here we will define each to help you better understand the sizing methods used when referring to lumber "size". This measuring method is probably the most recognized by the average person. We see this type of measuring method used in almost all "Do-It-Yourself" type stores that sell lumber, or any place selling lumber for construction purposes. We recognize such "sizes" as 2x4, 2x6, 4x4, 1x2, etc. This measurement refers to the thickness and width of the lumber and the length varies. In reality, these measurements are not a true measurement of the lumber thickness or width. The true measurement of a 2x4 is actually about 1. When the board is first rough sawn from the log, it is a true 2x4, but the drying process and planing of the board reduce it to the finished 1. The lumber is then sold as a "2x4" because the cost of the drying and machining are figured in The "Quarters" Sizing Method: In the case of rough sawn lumber, the "Quarters" sizing method is usually used by mills that sell rough lumber for woodworking purposes. The "Quarters" method refers only to the thickness of the wood as widths and lengths vary depending on the log the wood is cut from. Generally, a woodworker will plane the boards to the desired thickness and most likely rip the boards and glue them up into joined panels to get the desired width. Rough sawn lumber comes in "true" thicknesses as reflected by the "quarters" size. Lumber sized according to "Quarters" reflects the number of quarters of an inch thick the lumber is. To figure the thickness of a board referenced in "quarters" sizes, simply divide the second number 4 into the first number. The second number 4 means "quarters of an inch", or "quarters". Rough sawn lumber is usually sold by the "board foot" bd. A board foot is equal to a piece of wood 12 inches long x 12 inches wide and 1 inch thick, or cubic inches. To figure the board foot measurement of a piece of wood, multiply the length x width x thickness in inches, then divide by For more on lumber sizing be sure visit our lumber sizes page. Board Footage Calculator Use this calculator to find out many board feet a piece of lumber is based on its thickness, width, and length. Thickness in inches Length in feet Board Feet Sorry your browser does not support frames or is currently not set to accept them. You can fill out the standard form here.
