*Teach Me To Talk: The Therapy Manual is the go-to resource for speech therapy for toddlers. Pediatric speech-language pathologists RAVE about this manual in courses and follow-up emails!*

I am supporter of questioning everything we do. This means questioning others who might practice in a manner differently from me, this means challenging colleagues who share my same bias I tend to spend most of my time doing that and it also means being very critical of dubious practices i. I do much less of the last one and only sometimes delve into the first area. In Canada we have the Canadian Physiotherapy Association and within that there are Divisions which represent specific areas of practice. One division is the Orthopaedic Division. The Orthodiv is primarily seen as the Manual Therapy division I know that this is not all that they teach but this seems to be a large part of their training. I think trying to create highly educated therapists is great. But it misses the primary issue. So, what is my point? What are the critical reflections?. People will often tell me that the training in the Orthodiv goes beyond manual therapy and they regularly learn about the neuroscience of pain and dip into biopsychosocial reasoning in the training. Or that other material is covered and students learn to be better at clinical reasoning. But that is not the issue. The fundamental issue is how manual therapy is performed and explained, and the implicit assumption that manual therapy is a necessary part of being a highly trained clinician or an Advanced MSK Physio. Here is a true or potentially untrue anecdote. Subsequently, I urinated on his living room rug. When everyone rightly complained about this inappropriate behavior I asked them to just ignore the pee on the rug and focus on the great spinach dip that I had brought and how much better it made their night. No one focused on the spinach dip. You might have a case here where best evidence is conflicting with historical teachings. The performance and justification of manual therapy that is taught is outdated and false I have read the manuals that teach manual therapy. I have read the examiners corner instructions that justify teaching manual therapy in a certain way. Much of what is still taught is antiquated and based on fully unsupported models. Let me give a few examples of areas that extremely questionable: An example would be thrusting in any direction that is not perpendicular to a bone and arguing that the force vector in that direction will create movement in that direction. Let me give you a quote from Jesse Awenus. Manual Therapy is the Royalty of all Therapy I had a colleague who took the initial training with the Orthopaedic Division but she could not become a full FCAMPT because she refused to perform cervical manipulation of the spine. This is taught in the later levels because for some reason people think its difficult to crack the neck and you need to develop your technique elsewhere first. I cracked thousands of necks in chiro college.. Regardless, this elevation of manual therapy, which is at best a consistent secondary adjunct for helping people with painful conditions is a big issue. Do you see the disconnect here? An emphasis is placed on the approach that is not best practice. I am not a manual therapy basher see this paper here. Yet, when you make learning it a necessary part of the program you do just that. This is why its not a debate about hands on versus hands off. If you want to do some manual therapy, fine go ahead. But, you never HAVE to do manual therapy. Manual therapy is option but is never a requirement. And that leads us to a conclusion or even a recommendation. I fully recognize that the Orthopaedic Division has no obligation to listen or do anything. I mean, who the hell am I to tell them how to run their ship. In other words, an adjunct did you see what I did there? A lot of these courses both fundamentals and electives already exist in North America and the world so much could even be farmed out. Taught in an historical, whimsical way, like Astrology something. You could still teach the manual therapy that is currently taught but teach it as an elective and perhaps with an extremely critical bend. We did a similar thing at Canadian Memorial Chiropractic College in Motion palpation, specificity and incredibly questionable techniques were taught but all with an understanding that the research did not support the things that people had said. There are definitely excellent clinicians and there are definitely dedicated teachers in the program. But Jesse says it better: The program I was taught gave me a much more solid foundation in differential diagnosis, screening for red flags and understanding anatomy at a much deeper level. I feel better off for having been through the system and I am glad I stuck through it. There are rumblings that when the new manuals come out next year there will be

less emphasis on motion palpation and biomechanics and more emphasis on neuroscience education and a more current model explaining the possible reasons why our hands can help make people feel so much better. I welcome these changes and hope to see more made in the future to keep our program relevant in light of all the emerging evidence surrounding manual therapy. I would be happy to help in any way that I can.

### 2: Teach Me to Talk: The Therapy Manual - Google Books

*Therapy Manual to address receptive and expressive language delays in toddlers and young preschoolers.*

You can find Part 1 of my series, Why Early Intervention? What does she do? I am with a child for one hour. Sure my toy would be new and exciting for a child, but what happens when I leave? The parents are left without the toy I brought in and no idea how to carry over what we did in our session throughout the rest of the week. To begin with, some of our houses might not have toys available to use. Head outside and pick some dandelions, dig in dirt for worms, play hopscotch, climb on the jungle gym. Stay inside and use the couch cushions and a blanket to build a fort, search through the cabinets and make drums out of pots and a spoon, help with a load of laundry or the sink full of dishes, eat a snack or help cook lunch, get out the shaving cream and get messy. The possibilities are literally endless, you just have to be open to take a chance. Sure, you might fail. I would be lying if I said every one of my sessions went perfectly. However, I can honestly say that my kids are learning. Choose one client that you feel comfortable with and whose parents are on board for the change. There are certain circumstances when you need to bring something in. You might be working on feeding and bring in a puppet to play with. So bring it in, play with it, and show the parents the success their child is having. Make sure that they are able to have success with their own items before you leave. The next session, you might not have to bring that toy back in. I hope that if you are an Early Intervention SLP, you will consider ditching the bag for one session and seeing how it goes. You might decide that you hate it. At least you tried! Or, you might decide that you like not having to lug that heavy bag around. Your shoulder might thank you as well! My friend over at Sublime Speech recently did a 3 part series about being a "Bagless SLP" , so be sure to check out her posts as well! You can view a great parent testimonial video on their thoughts of the toy bag there too. Have you tried going bagless? What has been your biggest challenge or your best moment? Be sure to enter my giveaway of Teach Me to Talk: The Therapy Manual on Part 1 of this blog series. And check out Part 3, Why We Play, here!

The Therapy Manual is the go-to resource for speech therapy for toddlers. This best-selling therapy manual is essential for any speech-language pathologist, developmental therapist, early intervention specialist or other EI professional who treats toddlers with communication delays and disorders. Although not an academic text, Teach Me To Talk: Every language milestone from under 12 months until age 4 is included in this resource. The practical treatment manual is divided into 2 parts. Part II outlines a comprehensive list of therapy goals with highly detailed instructions for targeting each milestone in sessions with a variety of activity ideas. Order that set here. Read Feedback from SLPs: It has helped me understand language development more thoroughly and most importantly the prerequisite skills which I have seen so many times forgotten about. I am a seasoned SLP with 34 rewarding years experience with school aged kiddos. I am retiring from my school position in 2 weeks and have already been hired by a wonderful Early Intervention agency in Pittsburgh. This manual is absolutely fantastic! Thank you Laura for sharing your expertise! The OT I work for has stated several times this week that I seem like a different clinician with fun new stuff!! I feel like I have talked to parents more effectively and had more fun. I love the way you have the information organized. You have given great examples to use in several of the areas I struggle with targeting. I also love your ideas for getting parents involved. Every EI therapist should read this book!!!!!! Moms who have not had access to quality services including parents who live outside the USA have reported that this was their best resource for understanding not only what to work on with their children with language delays, but why and how SLPs select goals and implement strategies in specific play activities with toddlers. Although he is getting some therapy at school, it is not enough for him. Your book has helped me know that. Now while he is at school I try to pick out something for us to do when he gets home in the afternoon.
