The lousewort starts out tentatively, its leaves clutched in tight clusters the size of ping-pong balls, but soon enough it shoots up a wooly stalk, unfurls rows of pink blossoms, and welcomes its first visitor. The sight of that first visitor can be startling. She is the queen of beasts among the tundra flowers. Big and hairy and social by nature, the Arctic bumblebee *Bombus polaris* is exquisitely adapted to life in the northern latitudes—where life in turn is often exquisitely adapted to this bushy brightly-colored bee. She has been hibernating for the past nine months at least, suspended in an almost lifeless state in a mouse nest or some other subterranean burrow, waiting for the ground to warm. Already mated, the queen is the sole survivor of her colony and she has no time to lose. Some insects take years to complete their life cycle in the Arctic. A moth caterpillar, clocked at 12 years to pupation, grows a bit each year, freezes, then grows a bit more. A bumblebee in the Arctic, however, must get busy right away, said biologist Bernd Heinrich. Heinrich, a retired entomology professor from the University of Vermont, is probably best known for his popular books on ravens. As a youth, he wanted to study them but said he was advised never to study an animal smarter than himself. Still, he has found that insects are pretty smart too. About fifty species are found in all kinds of habitats across the U. These are important features for B. She has eggs to lay and the eggs must hatch out their larvae, which in turn must grow, pupate, and develop into adults. With time for only a couple of broods, she must also lay very large egg clutches. All this takes prodigious amounts of energy so she visits the early flowers, like the louseworts, the avens, and the willow catkins, pollinating as she goes. Heinrich said she gravitates towards flowers with multiple blooms where she can walk around and cool down a bit. She also seeks out nectar-heavy flowers. His studies show she burns a little hotter for them. As she sips nectar and feeds on protein-rich pollen, the queen has already started incubating her eggs internally. Other members of the B. Temperate bumblebee colonies generally produce hundreds of successful queens. In the Arctic, only one queen per colony on average will survive the winter to renew the life cycle. And the old queen? She will die with her progeny. 2: "Baby Bumble Bee" Song Lyrics - Considerable

Bumble Bee The Busy Bumble Bee Author: Kristina Corona Illustrator: Ms. Mena's Kindergarten Class and Internet Aa Bumble bees have an antenna. Bb There.

Braathens Rederi alone was in such high demand for corporate charter that the airline could nearly fill one plane with that group alone. Initially it operated a fleet of a Piper Aztec turboprop and a Learjet 23, the latter the first corporate jet operating out of Norway. Both the Cessnas were seaplanes, [6] which operated out of the water airport at Fornebu. A typical task would involve flying spare parts and technicians to a far-away port to make crucial repairs to ships, allowing faster reentry into revenue service. The aircraft were gradually repainted in white, red and blue to more closely match that of Braathens SAFE. However, a few of their routes were not sufficiently heavily trafficked to warrant jetliners. An arrangement was reached whereby the three newest Fs were transferred to Busy Bee, one each in , and The aircraft received a new yellow and brown livery with a bee on the vertical stabilizer. With smaller capacity and higher frequency, Busy Bee was able to triple patronage within three years and brought profitability to the route. Instead they established what would become SAS Commuter. In May it ordered four new F27s with delivery the following year. In June it ordered four Fokker 50s with delivery in late Busy Bee was the regular partner of Gulliver, who contracted the Boeing to fly three weekend trips during the summer to Greece. The company estimated that half its profits derived from the military contract. This hit Busy Bee particularly hard, as it had a large portion of its revenue tied up with the military contracts. They were unable to sell three of the F27s which had been replaced with F50s the previous year. However, the company was able to downsize easily after 30 pilots resigned to work for SAS Commuter, which expanded its operations in Northern Norway in Thus the need for the evaporated from April. Several business models were considered, either with Norwegian Commuter pooling regional operations operated by the two existing companies, or an all-ot merger. This was made conditional of both downsizing and wage reductions. One million kroner was raised in capital. During the initial Busy Bee period from to , it had honey-colored detailing. During the Air Executive period until , the airline had a mixed white, blue and red livery, which brought it close to that used by its larger sister company. The Busy Bee brand was reintroduced in , after which the airline used a honey and brown cheatline and decorated the vertical stabilizer with a bee. The aircraft was bought through a partnership with the Norwegian Armed Forces, in which it was specially equipped to meet military needs. Specifically, it was a combi variant, which encompassed a side loading door and the possibility to quickly rearrange the interior between all-passenger, all-freight, combined passenger and freight, as well as VIP configuration. The aircraft was designed to be able to operate out from gravel runways and was also as the only certified to be used for parachuting.
